Reactivity of atoms and groups in organic compounds. II. Second contribution on the relative reactivities of the hydroxyl-hydrogen atoms in certain alcohols. J. F. NORRIS AND FRANK CORTESE. *J. Am. Chem. Soc.* 49, 2640-50(1927); cf. C. A. 19, 1244. The 2nd-order velocity consts. for the reaction between $p-O_2NC_6H_4COCl$ and the following alcs. are reported: pentan-1-ol, 0.079; hexan-1-ol, 0.85; heptan-1-ol 0.69; 2-methylbutan-1-ol, 0.36; 2-methylpentan-1-ol, 0.34; 3-methylbutan-1-ol, 0.73; 3-methylpentan-1-ol, 0.77; 3-methylhexan-1-ol, 0.75; 4-methylpentan-1-ol, 0.68; pentan-2-ol, 0.0059; hexan-2-ol, 0.0065; pentan-3-ol, 0.0036; heptan-4-ol, 0.0027; 2-methylbutan-2-ol, 0.0025; 3-methylpentan-3-ol, 0.0014; α -phenylethyl alc., 0.00052; α -phenylpropyl alc., 0.00050; α -phenylbutyl alc., 0.00050. From these and previously reported values, 10 conclusions are drawn as to the relation of constitution and this const. The values decrease rapidly with decreasing concn.; in the above values, 1 mol. alc., 1 mol. acyl chloride and 1000 g. Et_2O are used, the temp. being 25° and the deviation of any single detn. from the mean was 2-10%.

C. J. WEST

Activity of fluorine in organic compounds. B. V. TRONOV AND E. A. KRÜGER. *J. Russ. Phys.-Chem. Soc.* 58, 1270-7(1926).— $Me_3CHCH_2CH_2F$, from C_6H_5I and AgF , $d_4^{14.6}$ 0.69945, $d_4^{19.6}$ 0.69415. PhF was prepd. from phenylazopiperidine. In the re-

actions (1) $\text{Me}_2\text{CHCH}_2\text{CH}_2\text{X}$ with piperidine, (2) $\text{Me}_2\text{CHCH}_2\text{CH}_2\text{X}$ with MeONa , (3) PhX with piperidine, and (4) PhX with MeONa , for $\text{X} = \text{F}, \text{Cl}, \text{Br}$ and I , resp., the reactivities are (1) 1, 68.5, 17,800, 50,500; (2) 1, 71.00, 3550, 4500; (3) 1, 1.9, 74.5, 132; (4) 1, 1.8, 4.4, 35.6.

Alkylation by *p*-toluenesulfonic esters. L. BLANCHARD. *Bull. soc. chim.* **41**, 824-33(1927).—Chlorobromohydrin, $b_{197} 197^\circ$, $b_{20} 92^\circ$, chloriodohydrin, $b_{19} 107^\circ$ and chloromethylin were prepd. by treating epichlorohydrin with HBr , HI and MeOH , resp. Conc'd. NaOH with chloromethylin gave *epimethylin*, $b_{170} 113-4^\circ$, $d_4 1.002$, $n 1.41158$. HBr and HI acting on epimethylin gave *bromomethylin*, $b_{12} 79^\circ$, $d_7 1.545$, $n 1.4832$ and *iodomethylin*, $b_{11} 93-4^\circ$, $d_6 1.851$, $n 1.5363$, resp. Condensing the halogen derivs. above with $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{Me}$, B. obtained *methoxy-2-dichloropropane*, $b. 160^\circ$, *methoxy-2-chlorobromopropane*, $b_{18} 70-2^\circ$, $d_{15} 1.54$, $n 1.48519$, *dimethoxy-1,2-chloropropane*, $b. 156-7^\circ$, $d_{15} 1.088$, $n 1.432$. *Methoxy-2-chloriodopropane* decompd. at 140° and could not be obtained by this method. Condensation of $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{Cl}$ and dichlorohydrin in presence of NaOH gave *dichlorohydrin-*p*-toluenesulfonate*, $m. 52-3^\circ$, $b_{13} 180-210^\circ$, $d_{15} 1.356$, $n 1.53572$.

Affinity, reactivity and structure in acetal formation. II. WALTER H. HARTUNG AND HOMER ADKINS. *J. Am. Chem. Soc.* **49**, 2517-24(1927); cf. *C. A.* **19**, 1694.—The equil. const's. for the reaction of EtOH with $\text{H}_2\text{NCH}_2\text{CHO}$, BrCH_2CHO , NCCH_2CHO , $\text{C}_6\text{H}_{11}\text{CHO}$, MeCH_2CHO , $\text{HN}\cdot\text{CHCHO}$, AcH , $\text{C}_2\text{H}_5\text{CH}_2\text{CHO}$, Me_2CHCHO , $\text{CICH}_2\text{CH}_2\text{CHO}$, HOCH_2CHO , $\text{CH}_2\cdot\text{CHCHO}$, BzH , $\text{PhCH}\cdot\text{CHCHO}$ and $\text{MeCH}\cdot\text{CHCHO}$ are given. The values of $-RT\ln K$ have been calcd. and used as the basis for a comparison of the relative affinity manifested by the various aldehydes in the acetal reaction. The effect of a given substituent upon affinity in the acetal reaction is neither quant. nor qual. const. The same substituent in some cases increases and in others decreases affinity. The normal-chain aliphatic aldehydes occupy, within a relatively narrow range, nearly the same position and are very high in the scale, whereas Me_2CHCHO is decidedly lower. Methods for the synthesis of several acetals are given and some of their phys. const's. are reported.

Isopropyl alcohol. H. S. GARLICK. *Ind. Chemist* **3**, 392-4(1927).—The physical and chemical properties of isopropyl alc. are enumerated and discussed, also its physiol. action and its com. possibilities. Its manuf. from "cracking gases" and from acetone is described.

A revision of the pentanols. S. M. GORDON AND EDWARD KREMERS. *J. Am. Pharm. Assocn.* **16**, 222-4, 313-22, 419-25(1927).—Principally a review of the literature with discussion. α -Naphthylurethan of AmOH , $m. 66-7^\circ$; of *sec*- BuCH_2OH , $m. 76^\circ$; of *iso*- BuCH_2OH , $m. 61-2^\circ$; of Et_2CHOH , $m. 68^\circ$; of PrMeCHOH , $m. 76^\circ$; and of *tert*- BuCH_2OH , $m. 71^\circ$. The acid 3-nitrophthalates of several pentanols were prepd. The *m. ps.* lie sufficiently far apart to be of aid in identification; pentyl, $m. 132-3^\circ$; γ -methylbutyl, $m. 165-6^\circ$; β -methylbutyl, $m. 157-8^\circ$; α -methylbutyl, $m. 102-3^\circ$; and α -ethylpropyl, $m. 92^\circ$. Tertiary AmOH did not react.

Methyl amyl ketone. J. R. JOHNSON AND F. D. HAGER. *Org. Syntheses* **7**, 60-2 (1927).—Crude $\text{AcBuCHCO}_2\text{Et}$ (925 g.), added to 5 l. of 5% NaOH and the mixt. stirred at room temp. for 4 hrs., the aq. layer acidified with 500 cc. 50% H_2SO_4 and slowly heated to boiling, gives 52-61% of MeCOAm (based on $\text{AcCH}_2\text{CO}_2\text{Et}$ used).

Nitrosyl chloride and ketones. E. V. LYNN AND F. A. LEE. *J. Am. Pharm. Assocn.* **16**, 309-12(1927); cf. *C. A.* **20**, 3659.—Add one g. mol. of NOCl (calcd. from the sulfate) to one of Me_2CO , keeping the latter cool. When the reaction is complete, remove the excess of Me_2CO and HCl by direct distn. Subject the residue to vacuum distn. and set the distillate aside in a freezing mixt. Collect the sepd. crystals and recrystallize from H_2O . Phorone mononitrosochloride, $m. 174^\circ$. Me_2CO reacts under varying circumstances to give isonitrosoacetone, chloroisnitrosoacetone, phorone mononitrosochloride, and probably phorone dinitrosochloride. MeEtCO gives the corresponding isonitroso compd. Dipropyl ketone gives an isonitroso compd.

Nitrogen trichloride and unsaturated ketones. G. H. COLEMAN AND DAVID CRAIG. *J. Am. Chem. Soc.* **49**, 2593-6(1927).— $\text{PhCH}\cdot\text{CHBz}$ (120 g.) in 800 cc. CCl_4 , cooled to 0° , treated with 220 mg. mols. of NCl_3 in 350 cc. CCl_4 , and shaken with 50 cc. conc'd. HCl gives among other products about 10% of the HCl salt of *1-amino-2-chloro-1,3-diphenylpropan-3-one*, $m. 206-8^\circ$ (decompn.); *Bz deriv.*, $m. 186-7^\circ$. Reduction with Na-Hg gives *1-amino-1,3-diphenylpropan-3-ol*, $m. 122-4^\circ$, which was also obtained by the reduction of $\text{PhC}(\text{NOH})\text{CH}_2\text{Bz}$ with Na-Hg .

Hydrogen cyanide (anhydrous). K. ZIEGLER. *Org. Syntheses* **7**, 50-2(1927).—

Details of app. and method for prep. HCN from NaCN and H_2SO_4 ; 93-7% yields.

C. J. WEST

Preparation and saponification of esters by the distillation method. II. Preparation of isoamyl acetate. L. GAY, P. MION AND M. AUMERAS. *Bull. soc. chim.* 41, 1027-40(1927); cf. C. A. 21, 1048.—A mixt. of iso-AmOH, AcOH, iso-AmOAc and H_2O has a min. dew point at 94° ; it corresponds to a binary mixt. of 0.788 mol. H_2O and 0.212 mol. ester. The results obtained in the present expts. refer to the case of the first distillate being a binary mixt., and were foretold in the previous theoretical study. Iso-AmOAc is very advantageously prepd. from an equimolar mixt. of alc. and acid because the residue of the distn. is practically pure ester, and the difficult sepn. of the acetate from the excess of alc. or acid is thus avoided.

A. L. HENNE

Salts of α -linolic tetrabromide (sodium, potassium, zinc, barium, calcium and strontium) from Philippine lumbang oil. ADELAIDA T. ORETA AND A. P. WEST. *Philippine J. Sci.* 33, 169-76(1927).— α -Linolic tetrabromide, $CH_3(CH_2)_4(CHBr)_2CH_2(CHBr)_2(CH_2)_7CO_2H$, m. p. $112.3-114.3^\circ$, has been prepared from lumbang oil. Its Na and K salts were prepared by treating the free acid in EtOH with an alc. soln. of the corresponding alkali. From the K salt, the Zn, Ba, Ca and Sr salts have been prepared. The m. ps. are: K: $154.7-8.8^\circ$; Ca: $208.7-13.4^\circ$; Sr: $200.4-6^\circ$; Ba: $196.3-206.5^\circ$; Na: $194.2-201.1^\circ$, all but the K salt decomp. during the melting. The solubilities of the various salts in 17 org. solvents have been qual. determined.

A. L. HENNE

Salts of linolenic hexabromide (Ca, Mg, Sr, and Ni) from Philippine lumbang oil. P. R. ALMORADIE AND A. P. WEST. *Philippine J. Sci.* 33, 257-63(1927).—Ca, Mg, Sr, and Ni salts of linolenic hexabromide were prepd. from the K salt by pptn. from PrOH soln. with the corresponding metal bromides (except $SrCl_2$). They decompose at $208-18^\circ$.

DAVID DAVIDSON

Condensation of ethylene oxides with alcohols in the presence of sulfuric acid as a catalyst. II. E. FOURNEAU AND I. RIBAS. *Bull. soc. chim.* 41, 1046-56(1927); cf. C. A. 21, 567.—The condensation of CH_3CH_2O (I), $ClCH_2CH_2O$ (II), and $EtMcCCH_2O$ (III), with $HOCH_2CH_2Cl$ (IV), in the presence of H_2SO_4 is studied. I and IV give 24-30% of $OCH_2CH_2OCH_2CH_2Cl$ (V),

20-25% of $HOCH_2CH_2OCH_2CH_2OCH_2CH_2Cl$ (VI). Me_2NH and V yield $HOCH_2CH_2OCH_2CH_2CH_2NMe_2$ (VII); the same reagent with VI gives $HOCH_2CH_2OCH_2CH_2OCH_2CH_2CH_2NMe_2$ (VIII). The benzoate and cinnamate esters of VII and VIII are local anesthetics; their picrates and hydrochlorides are very sol. in H_2O and very hygroscopic; their aq. solns. are neutral. II and IV yield 70% of $ClCH_2CH(OH)CH_2OCH_2CH_2Cl$ (IX), $b_{18} 123.5^\circ$. Me_2NH and IX give $Me_2NCH_2CH(OH)CH_2OCH_2CH_2NMe_2$ (X) (80-90% yield). The picrate of X is oily and barely sol. in H_2O or alc. The Bz ester crystals easily but is very hygroscopic. It does not exhibit any anesthetic property. III and IV in the presence of H_2SO_4 give a compd. $b_{18} 75^\circ$, which is possibly $MeEtCCH_2OC(MeEt)CH_2O$. In the absence of H_2SO_4 , and after a long heating,

$MeEtC(OH)CH_2OCH_2CH_2Cl$ (XI), $b_{18} 115-20^\circ$, is obtained. Me_2NH and XI give $MeEtC(OH)CH_2OCH_2CH_2NMe_2$ (60% yield), an oily liquid, very sol. in H_2O and in org. solvents. Its esters have a strong anesthetic power; their salts (picrate, chloride) cryst. easily.

A. L. HENNE

Chloroacetamide. W. A. JACOBS AND M. HEIDELBERGER. *Org. Syntheses* 7, 16-7(1927).— $ClCH_2CO_2Et$ and NH_3 at $0-5^\circ$ give 78-84% of $ClCH_2CONH_2$, m. $118-9^\circ$; recrystn. gives a pure product.

C. J. WEST

β -Hydroxypropionic acid. R. R. READ. *Org. Syntheses* 7, 54-6(1927).— $HOCH_2CH_2CN$ (250 g.), slowly added to a cold soln. of 160 g. NaOH in 500 cc. H_2O , the mixt. allowed to stand overnight at 30° , then slowly heated to 80° during 4 hrs., the mixt. evapd. to dryness in vacuo, 50 cc. H_2O added and then a mixt. of 200 g. concd. H_2SO_4 and 300 cc. H_2O , gives 28-31% of a liquid contg. 75-80% of $HOCH_2CH_2CO_2H$.

C. J. WEST

Ethyl butylacetoacetate. C. S. MARVEL AND F. D. HAGER. *Org. Syntheses* 7, 36-8(1927).—Detailed directions are given for the prepn. of $AcBuCHCO_2Et$ from $AcCH_2CO_2Et$, $EtONa$ and $BuBr$; the yields are 69-72%.

C. J. WEST

The so-called diethyl dicyanoglutaconate and some of its derivatives. II. YOSHIO YUKI URUSHIBARA. *Bull. Chem. Soc. Japan* 2, 236-41(1927); cf. C. A. 21, 1248.—The so-called diethyl dicyanoglutaconate (I) is to be distinguished from the real one (II) by the fact that its mol. contains one half mol. H_2O which cannot be removed.

II is not known in its free state. The mechanism of formation of the Na deriv. of II has been studied in the reactions already given in the literature, and the yields improved. The product having been obtained in a high degree of purity, the metallic salts obtained from it exhibited their true colorations; the Na deriv. is colorless; the Ag deriv. is a gelatinous ppt., transformed into a powder by heating; the Cu deriv. is pink-red, then turns reddish brown; the addition of NH_3 changes it into a white ppt., the supernatant liquid being bluish; the NH_4 deriv. is analogous to the Na deriv. By acidifying the hot aq. soln. of the Na deriv. of II, yellow crystals of I were pptd. The formula is $\text{C}_9\text{H}_8\text{O}_4\text{N}_2 \cdot \frac{1}{2}\text{H}_2\text{O}$, m. 225° . When Br is added to a suspension of I in CHCl_3 , a ppt. of no definite formula is obtained. It is collected and put into moist ether. A white solid is obtained, which is dissolved in alc., and an alc. soln. of picric acid is added. The picrate of dimethyl dicarbamylglutaconate, $\text{C}_6\text{H}_{12}\text{O}_6\text{N}_2\text{C}_6\text{H}_5\text{OH}(\text{NO}_2)_3$, is thus pptd.

A. L. HENNE

Guanidine nitrate. T. L. DAVIS. *Org. Syntheses* 7, 46-8(1927).— $\text{H}_2\text{NC}(\text{NH})\text{NHCN}$ and NH_4NO_3 , heated at 160° for 3 hrs., give 85-92% of $\text{H}_2\text{NC}(\text{NH})\text{NHNO}_3$.

C. J. WEST

Nitroguanidine. T. L. DAVIS. *Org. Syntheses* 7, 68-9(1927).—Crude $\text{H}_2\text{NC}(\text{NH})\text{NH}_2 \cdot \text{HNO}_3$ (560 g.) slowly added to 500 cc. cooled concd. H_2SO_4 and allowed to stand at room temp. until homogeneous, gives 73-5% of $\text{H}_2\text{NC}(\text{NH})\text{NHNO}_2$.

C. J. WEST

Preparation of ethoxallic acid and its chloride. E. FOURNEAU AND S. SABETAY. *Bull. soc. chim.* 41, 537-40(1927).— $(\text{CO}_2\text{Et})_2$ heated with anhyd. $\text{H}_2\text{C}_2\text{O}_4$ in excess at 130° gave a mono Et ester, which can be converted into ethoxalyl chloride by heating with SOCl_2 .

R. C. ROBERTS

Ethyl bromomalonate. C. S. PALMER AND P. W. MCWHERTER. *Org. Syntheses* 7, 34 5(1927).— $\text{CH}_2(\text{CO}_2\text{Et})_2$ is brominated in CCl_4 ; the yield of $\text{BrCH}(\text{CO}_2\text{Et})_2$ is 73-5%.

C. J. WEST

The action of sodium ethylate on the ethyl ester of 1,4-dibromoadipic acid. Polymers of muconic acid esters. KURT VOGT. *Mitt. schlesischen Kohlenforsch. Kaiser-Wilhelm Ges.* 2, 69-96(1925); *Chem. Zentr.* 1926, I, 2340-2.—To det. whether CO_2H and CO_2R groups have any influence on the polymerization of groups in butadiene, a study was made of muconic acid, $\text{HO}_2\text{CCH}:\text{CHCH}:\text{CHCO}_2\text{H}$ (I), and its esters. A satisfactory process for the prepn. of adipic acid, the necessary initial compd., was first developed. It was then converted to di-Et 1,4-dibromoadipate (II) by the method of Stephen and Weizmann (*C. A.* 7, 1707). By the action of NaOEt soln. on II, there was formed I by the splitting off of 2 HBr, tetrahydrofurandicarboxylic acid (III) by exchange of the Br atoms by OH and sepn. of H_2O , 1,4-diethoxyadipic acid (IV) and 1-hydroxy-4-ethoxyadipic acid lactone (V) by exchange of 1 Br atom by OEt , of the other Br by OH and sepn. of H_2O . V is characterized by the great stability of the lactone ring. Di-Et muconate was best adapted for polymerization expts. at high temps. From the resinous product a dimer ester was isolated, the compn. of which should be (VII) by analogy with the expts. of Hofmann on butadiene. This formula could not be verified because of insufficient material. Unlike polymers of butadiene and its derivs., the polymer with high h. p. did not resemble rubber, and its soly. was far different. Vulcanization tests were not carried out. Adipic acid was prepd. by oxidation of cyclohexene with KMnO_4 and o-quinite, or more readily by adding cyclohexanol to boiling HNO_3 (6 parts of d. 1.4). The acid was dissolved in boiling SOCl_2 , brominated and poured into EtOH, which yielded II, m. 65° . II (140 g.) in EtOH, boiled 1 hr. with Na (70 g.) in EtOH (1750 cc.), cooled, the ppt. dissolved in a little water and acidified with concd. H_2SO_4 , ppts. about 32% of I, decomps. $306-7^\circ$, not attacked by boiling AcCl , Ac_2O or SOCl_2 . The acid filtrate concd. and extd. with EtO, gives an oil and a cryst. substance. The latter on recrystn. yields 14-54% of III, m. $123-4^\circ$. The oil distd. in vacuo, fractionated, ketones removed with semicarbazide, the oil again distd. in vacuo, yields the anhydride of IV, $\text{C}_{10}\text{H}_{16}\text{O}_6$, b₁ $121-2^\circ$. Treated with cold concd. NaOH it forms 1,4-diethoxyadipic acid, oil. The oil also yields V, highly acidic, b₁ $130-2^\circ$. Alc. V satd. with HCl gas and boiled forms an oil, b₁ $122-3^\circ$. Et ester, $\text{C}_{10}\text{H}_{16}\text{O}_6$. Amide, $\text{C}_9\text{H}_{13}\text{O}_4\text{N}$, by treating the Et ester for 8 days with cold concd. NH_4OH , m. $203-6^\circ$. The di-Me ester of I, m. 154° , is prepd. from the acid chloride of I (which is prepd. from I and PCl_5 or POCl_3), from I and CH_3N_2 in EtOH, from I, Me_2SO , and NaOH, and from I in MeOH satd. with HCl gas and boiled. The di-Et ester (VI) of I, m. 64° , is prepd. by heating I with EtOH for 2 hrs. at 200° in a sealed tube, giving 14% yield, or better from I in EtOH satd. with HCl and boiled. For the polymerization, VI was heated in a tube 5 hrs. at 180° . Nothing was recovered on steam distn. of the resinous product.

but on distn. *in vacuo* (1 mm. Hg), the chief product b_1 208–30°. On fractionation this yielded the *dimer* of VI, with the compn. VII, green-yellow sirup with aromatic odor, b_1 221–2°, not saponif. by alc. KOH. The residue from this last distn. was a black pitch, which on sapon. with alc. KOH gave a coffee-brown adhesive product.

The Sicilian citric acid industry. ERICH GUTTMANN AND FRIEDRICH KLEMA. *Chem.-Ztg.* 51, 705–6, 726–7 (1927).

Preparation of cephalin. P. A. LEVENE AND IDA P. ROLF. *J. Biol. Chem.* 74, 713–4 (1927).—Brain tissue (40 lbs.), after drying, is extd. with about 20 l. Me_2CO , dried, extd. with 30 l. 95% EtOH and then with 20 l. Et_2O ; the concd. Et_2O ext. is allowed to stand overnight at 0°, centrifuged and the supernatant liquor poured into 98.5% EtOH at 60°; the ppt. is again dissolved in Et_2O , allowed to stand at 0° and the operation repeated as long as the Et_2O ext. deposits a sediment of white matter. The final product formed by pptn. with EtOH contains no $\text{NH}_2\text{-N}$. The yield is 18 g.

Progress in the structural study of carbohydrates. J. C. IRVINE. *Reviews* 4, 203–29 (1927).—Willard Gibbs medal award address.

C. J. WEST

Action of hydrochloric and of hydrobromic acids on sugars. H. COLIN AND (MLLE.) E. RUPPOL. *Bull. soc. chim. biol.* 9, 928–31 (1927).—The color reactions observed by Fenton and Gostling (cf. *J. Chem. Soc.* 73, 554; 79, 361) when various sugars are treated with HCl or HBr are reviewed and are repeated under varying conditions respecting the presence of moisture.

L. W. RIGGS

Diacetoneglucose. IV. α - and β -Isomers of 3,5,6-trimethylmethylglucoside and of 2,3,5,6-tetramethylmethylglucoside. P. A. LEVENE AND G. M. MEYER. *J. Biol. Chem.* 74, 701–11 (1927); cf. *C. A.* 21, 63.—The 3,5,6-trimethylmethylglucosides obtained from the monoacetone deriv. with MeOH contg. 0.5% HCl may be fractionated into the α -form, $b_{0.4}$ 105–9°, $[\alpha]_D^{20}$ 93° (MeOH) and the β -form, $b_{0.2}$ 145–50°, $[\alpha]_D^{20}$ 87°; both forms give an equil. value of about -12.5° to -13° (tables showing the rate of mutarotation in MeOH contg. 0.2% HCl are given); the velocities of inter-conversion are of the same order of magnitude. That the 2 compds. are the α - and β -forms is further confirmed by their hydrolysis and oxidation. Further methylation with an excess of MeI gives the 2,3,5,6-tetra-Me derivs., $b_{0.2}$ 105°, $[\alpha]_D^{20}$ 104° (MeOH) and 64°; the equil. rotations are $[\alpha]_D^{24}$ -22.5° and -17.7° . Hydrolysis gives tetramethylglucose with $[\alpha]_D^{20}$ -17.1° ; the *l*-rotatory fraction was contaminated with the *d*-form, so that the sugar has $[\alpha]_D^{20}$ -13.5° . The rates of mutarotation were practically the same. The rotation of the C atom (1) of the β forms has a higher value than that of the common forms.

α -Methyl mannoside. C. S. HUDSON. *Org. Syntheses* 7, 64–6 (1927).—Vegetable ivory waste (1 kg.) is kneaded with 1250 g. 85% H_2SO_4 , allowed to stand 15 hrs. at 25°, then a mixt. of 1 l. MeOH and 250 cc. concd. HCl added and the mixt. refluxed 8 hrs.; 480–520 g. α -methyl mannoside seps. from the light yellow filtrate.

C. J. W.

Pentamethyl-*d*-mannose and pentamethyl-*d*-galactose and their dimethyl acetals. P. A. LEVENE AND G. M. MEYER. *J. Biol. Chem.* 74, 695–9 (1927).—Detailed directions are given for the prepn. of diethylmercaptomannose. Methylation, 1st with Me_2SO_4 and NaOH and then with Na and MeI (cf. *C. A.* 20, 2987), gives pentamethyl-diethylmercaptomannose, $b_{0.2}$ 155–60°, $[\alpha]_D^{20}$ 39.4° (MeOH); hydrolysis with HgCl_2 in MeOH gives pentamethyl-*d*-mannose, $b_{0.1}$ 98–100°, $[\alpha]_D^{20}$ 9.1° ($\text{C}_2\text{H}_5\text{Cl}$), $[\alpha]_D^{25}$ 8.00° (MeOH); at room temp. in 10 min., $[\alpha]_D^{20}$ 12.30° and finally gives the equil. value of 17.8°; the deriv. reduces Fehling soln. on warming and alk. AgNO_3 in the cold. The dimethyl acetal, $b_{0.1}$ 112–4°, $[\alpha]_D^{20}$ 21.2° (MeOH) and 19.3° ($\text{C}_2\text{H}_5\text{Cl}$). Pentamethyl-diethylmercaptogalactose, $b_{0.1}$ 155–60°, optically inactive in 11% MeOH soln. Pentamethyl-*d*-galactose, $[\alpha]_D^{20}$ -4.8° ($\text{C}_2\text{H}_5\text{Cl}$); in MeOH (c 4.54), there was no appreciable rotation at the time of mixing, after 1 hr. $[\alpha]_D^{20}$ is -6° and finally reaches the equil. value of -10° ; in MeOH contg. 0.2% HCl, the equil. value is immediately reached. The dimethylacetal, $b_{0.1}$ 118–20°.

C. J. WEST

Effect of ionization upon optical rotation. III. Relation in the 2,5-anhydro sugar acids. P. A. LEVENE and LAWRENCE W. BASS. *J. Biol. Chem.* **74**, 727-37(1927); cf. *C. A.* **21**, 1965.—Titration-rotation data have been detd. for mannonic (I), 2,5-anhydromannonic (II), mannosaccharic (III), 2,5-anhydromannosaccharic (IV), and 2,5-anhydrosaccharic (V) acids. From these data accurate values of the rotations of the different mol. species have been calcd. The $[M_m]$ values reported are: I, -24.2° ; II, 81.1° ; III, 40° ; IV, 112.4° ; V, 102.0° . A comparison of these rotation values shows that the presence of a stabilizing ring decreases the change in rotation on passing from 1 mol. species to another. A comparison of the data for IV and V shows that the change in rotation on passing from 1 mol. species to another is roughly proportional to the distance traversed by the ionizable groups during the transformation, as measured by means of structural models. The original should be consulted for the detailed measurements. C. J. WEST

Hydroxyamino compounds which show the biuret reaction. III. Resolution of γ -amino- β -hydroxybutyric acid into the optically active components. MASAJI TOMITA and YUZO SENDJU. *Z. physiol. Chem.* **169**, 263-77(1927); cf. *C. A.* **21**, 62.—By means of brucine, *dl*-BzNHCH₂CH(OH)CH₂CO₂H was sepd. into the *l*- and *d*-salts, m. 87° and 41° , resp. Removal of brucine and crystn. of the free acid gave in each case 2 pairs of isomers: *l*- γ -benzamido- β -hydroxybutyric acid, m. 172° , $[\alpha]_D^{20} -7.59$ (I) and m. 114° , $[\alpha]_D^{20} -11.84^\circ$ (II), resp., and the corresponding *d*-acid, m. 178° , $[\alpha]_D^{20} 4.08^\circ$ (III) and m. 116° , $[\alpha]_D^{20} 10.0^\circ$ (IV), resp. II and IV m. $80-1^\circ$ and $78-80^\circ$, resp., before removal of H₂O of crystn. Removal of Bz by hydrolysis gave 4 corresponding γ -amino- β -hydroxybutyric acids, m. 213° , $[\alpha]_D^{20} -3.40^\circ$, m. 212° , $[\alpha]_D^{20} -21.06^\circ$, m. 214° , $[\alpha]_D^{20} 3.21^\circ$ and m. 214° , $[\alpha]_D^{20} 18.30^\circ$, resp. Complete methylation of these 4 amino acids with MeI and KOH in MeOH gave 4 γ -trimethyl- β -hydroxybutyrobetaines: $[\alpha]_D^{20} -7.25^\circ$, AuCl₃ salt m. $151-2^\circ$; $[\alpha]_D^{20} -20.98^\circ$ (IIa), AuCl₃ salt m. 155° , PtCl₄ salt m. 200° , HgCl₂ salt m. 204° ; $[\alpha]_D^{20} 8.42^\circ$, AuCl₃ salt m. $150-1^\circ$; and $[\alpha]_D^{20} 20.20^\circ$, AuCl₃ salt m. 155° . IIa is identical with carnitine. The isomerism of the *2l* and the *2d* forms in these series is due, not to a 2nd asymmetric C atom, but to the lack of a plane of symmetry in their spatial formulas. A. W. DOX

Proteins. IV. STEFAN GOLDSCHMIDT, EGON WIEBERG, FRIEDRICH NAGEL and KARL MARTIN. *Ann.* **456**, 1-38(1927); cf. *C. A.* **21**, 1990.—1. *The degradation of polypeptides and amino acids by hypobromite* (Wieberg). Benzoylleucylglycine and the 2 diastereoisomeric forms of benzoylleucylalanylglycine are stable toward HOBr as long as hydrolytic splitting is avoided. Thus it may be considered proved that the NHCO linkage in open polypeptide chains is stable toward HOBr. The nonacetylated polypeptides behave differently toward HOBr depending upon whether an alk. or neutral medium is used; in about 0.2 *N* alkali, 2 mols. HOBr are quickly used up (1-2 min.), while in neutral soln. (about 0.001 *N* alkali), there is a rapid utilization of 1 mol HBr and then a slow utilization of about 1.5 mols. with evolution of N. The reaction between NH₂ acids and HOBr is independent of the alkali concn., 2 mols. HOBr being used. In neutral soln. the keto acid corresponding to the dipeptide is obtained; thus leucylglycine gives [2-methyl-4-ketovaleryl]glycine, analyzed as the hydrazone, golden yellow, m. 200° ; valylglycine gives [2-methyl-3-ketobutyl]glycine hydrazone, m. 152° . In the alk. reaction a nitrile and an NH₂ acid are obtained; thus, valylglycine gives isobutyronitrile and glycine. Leucine in neutral KOBr gives isovaleronitrile; if the aq. soln. is covered with Et₂O, there is obtained in addn. to the nitrile, the aldehyde, resulting from the intermediate imine. 2. *Action of hypobromite on diketopiperazines* (Nagel). In neutral soln. there is no decompn. but only a *N*-bromination of the diketopiperazine ring. *N*-Dibromovalanine anhydride, decompn. 110° (70% yield); *N*-dibromoleucine anhydride, m. 269° . In the alk. decompn. alanine anhydride gives alanine-HBr, AcOH and NH₃; leucine anhydride, isobutylhydantoin and C₆H₅CO₂H. Pyrrolidonecarboxylic acids and their esters are not attacked by hypobromite. 3. *Degradation of egg albumin by hypobromite* (Martin). From the reaction product of 50 g. albumin in 500 cc. H₂O, treated with 106 cc. Br, 310 g. KOH and 4 l. H₂O at -2° , there seps. about 1 g. of the compd. C₂Br₄O₃S, m. 134° , reduced by HI to a compd. m. $161-2^\circ$. There are also isolated (CH₂CO₂H)₂, BzOH, AcOH and valeronitrile. C. J. WEST

Racemization. V. Action of alkali on gelatin. P. A. LEVENE and L. W. BASS. *J. Biol. Chem.* **74**, 715-25(1927); cf. *C. A.* **21**, 97.—The rotations and NH₂:N ratios have been detd. for the mixt. of NH₂ acids obtained from gelatin by acid hydrolysis under different conditions, among which was the previous action of alkali at 25° . In gelatin racemization of some of the NH₂ acids occurs on treatment with 0.1 *N* and with 1.0 *N*

alkali but not on treatment with 3.0 *N* alkali. The absence of racemization in the 3rd case is explained by the fact that under these conditions the rate of hydrolysis is higher than the rate of racemization. These results, when compared with previous results on the racemization of ketopiperazines, indicate the possibility of the presence of ketopiperazines in the gelatin mol. The results are in harmony with the data of Dakin on the racemization of gelatin by alkali on 1 hand and on the hydrolytic products of gelatin on the other.

C. J. WEST

Aromatic and hydroaromatic compounds of lignite tar. I. J. HERZENBERG AND S. RUHEMANN. *Braunkohle* 26, 526-32(1927); see *C. A.* 21, 2122. II. J. HERZENBERG AND S. RUHEMANN. *Ibid* 558-64.—Attempts to isolate the hydroaromatic hydrocarbons, as such, from the 120-6° fraction, gave negative results. Br and anhyd. HCl each gave only resin, and cold concd. H₂SO₄ produced not only sulfonation but dehydrogenation as well. Pure cadinene behaved similarly. This is unfavorable to the use of H₂SO₄ as a refining agent for tar-benzine, etc.

F. S. GRANGER

Chemical properties of limonene. A. AUDRAIN. *Bull. inst. pin* 1927, 33-4 55-6, 91-2, 183-90; *Pine Inst. America Abstracts* 1, 24(1927).—A survey of the literature concerning the prepn. and chem. properties of limonene, with numerous references and a bibliography. Directions are given for the lab. prepn. of limonene and its various derivs.

A. PAPINEAU-COUTURE

The course of simple transformations of tautomeric compounds. K. VON AUWERS, G. WEGENER AND TH. BAHR. *Sitz.-Ber. Ges. Bef. ges. Naturwiss. Marburg* 1925, 18 pp.; *Chem. Zentr.* 1926, 1, 2347-8.—To explain the formation of *C*-substituents from salts of keto-enols and alkyl halides ("abnormal" transformation), 3 hypotheses have been advanced: (1) the initial formation of addn. products with subsequent splitting (Michael); (2) the initial formation of normal *O* derivs., with rearrangement of these into *C* derivs., and (3) the sepn. of the metal as a metallic halide, formation of free alkyl

and enol radicals, $\begin{array}{c} \text{---C=C<} \\ | \\ \text{O} \end{array} \rightarrow \begin{array}{c} \text{---C-C<} \\ || \quad | \\ \text{O} \end{array}$ and with the slight reactivity of the

alkyl group partial or complete rearrangement of the enol to keto radical, and finally union of the radicals (Wislicenus). Recent investigations have shown that the course of the alkylation of a keto-enol depends upon its character and upon the alkylation agent. Examples are cited. New expts. with esters of hydroxycoumarilic acid and with 1-cyano-2-cyclohexanone show that satd. alkyl halides promote the formation of *O* derivs. and allyl and benzyl halides promote the formation of *C* derivs. This conforms with the recent expts. of Claisen (*C. A.* 19, 2038) on the alkylation of phenols. Here too allyl, benzyl and similar radicals furnish preponderantly *C* derivs. and satd. alkyl radicals form *O* derivs. At the same time, inactive media favor the formation of *C* derivs. and dissociating media that of *O* derivs. These facts are well explained by the first hypothesis, on which the theoretical considerations of Claisen are also based. *In dissociating media the exchange between the ions is more strongly manifest. The second hypothesis is inadequate, for it is not comprehensible why an *O*-ether should be transformed into a *C* deriv. in C₆H₆ more easily than in EtOH. According to the third hypothesis, *O*-ethers should be formed with allyl and with benzyl radicals because of their great reactivity, but this is not the case. Nevertheless the formation of radicals and the isomerization of enol to keto radicals is necessary to explain the reactions. Since allyl and benzyl radicals are distinguished by their slight valence requirements and therefore hold O only loosely, they show a preference for combining with C to form a stabile combination. Tautomerism in pyrazoles, indazoles and tetrahydroindazoles are then discussed, with special reference to their reactions with alkyl halides. Works of A. and his collaborators and numerous previous works are cited. In general the reactions are comprehensible if they are regarded partly as substitution, partly as addn. reactions. In the first case the H or the Na bound to N replaces directly the radical of the alkyl halide, in the second case the alkyl halide adds to the tertiary N and then the H halide or Na halide is evolved. The very complicated reactions of Ag indazole with alkyl halides can perhaps be understood if the intermediate formation of radicals as with

keto-enols $\begin{array}{c} \text{CH} \\ \diagup \quad \diagdown \\ \text{C}_6\text{H}_4 \quad \text{N} \\ \diagdown \quad \diagup \\ \text{N} \end{array} \rightleftharpoons \begin{array}{c} \text{CH} \\ \diagup \quad \diagdown \\ \text{C}_6\text{H}_4 \quad \text{N} \text{---} \\ \diagdown \quad \diagup \\ \text{N} \end{array}$ is assumed, and the different affinity

characteristics of the alkyl radicals are taken into account.

C. C. DAVIS

The constitution of the Grignard organomagnesium derivatives. D. IVANOV. *Compt. rend.* 185, 505-7(1927); cf. following abstract.—The purpose of the work is to find arguments for making a choice between the asymmetric formula RMgX proposed

by Grignard, and the symmetric formula $R_2Mg \cdot MgX_2$ given by Jolibois. The product obtained by the carbonation of the Grignard reagent is extd. with dry Et_2O . It is assumed that the Mg halide must not be removed, if the compd. has the asymmetric formula RCO_2MgX , and that it must be extd. if it has the symmetric formula $(RCO_2)_2Mg \cdot MgX_2$. I. succeeded in extg. in this way about 30% of the Mg halide, and consequently adopts the formula of Jolibois.

A. L. HENNE

Remarks to the note of Ivanov: "Constitution of the Grignard organomagnesium derivatives." V. GRIGNARD. *Compt. rend.* 185, 507-9(1927); cf. preceding abstract.—The soly. of $MgBr_2$ in Et_2O is 45% at 28° and 0.08% at 0°. After a very long extn., Ivanov succeeded in removing only 30% of the $MgBr_2$ present in the Grignard reagent. This fact must be considered as an argument against the formula of Jolibois. It may be admitted that in the Grignard reagent an equil. exists between the two formulas, but in that case, only a very minute quantity of the compd. would have the symmetric formula.

A. L. HENNE

Use of nitrogen tetroxide in place of nitric acid in organic nitrations. L. A. PINCK. *J. Am. Chem. Soc.* 49, 2536-9(1927).—A method for the nitration of org. substances with N_2O_4 in the presence of H_2SO_4 is described, C_6H_6 , $PhNO_2$, $PhMe$ and $C_{10}H_8$ being used as examples. The method involves the intermediate reaction of the N_2O_4 with the H_2SO_4 , whereby nitrating and dehydrating reagents are simultaneously formed. The yields of the NO_2 compds. range from 87% to upwards of 90% of the theoretical.

C. J. WEST

3,5-Dinitroanisole. FREDERIC REVERDIN. *Org. Syntheses* 7, 28-9(1927).—1,3,5- $C_6H_3(NO_2)_3$ and $MeONa$ give 63-77% of 3,5- $(O_2N)_2C_6H_3OMe$.

C. J. WEST

Terpineol from terpinol hydrate. A. ROBERT. *Bull. inst. pin* 1927, 153-6, 177-82; *Pine Inst. America Abstracts* 1, 24(1927).—Essentially a crit. review. A considerable amount of Wallach's work has been repeated and substantiated. Optimum conditions for the prepn. of terpineol from terpinol hydrate were found to be rapid heating in presence of H_2SO_4 (1/1500-1/2000) or phosphoric acid (1/1500). Industrial terpineol consists mainly of α -, a small proportion of γ -, and only traces of β -terpineol. The 2 former were sepd. in cryst. form by repeated crystns.

A. P.-C.

Genetic relation of terpenes. OSSIAN ASCHAN. *Svensk Kem. Tids.* 39, 165-78 (1927).—An address illustrated by many formulas showing the relationship of the terpenes and developing the hypothesis of their common origin by way of isoprene.

A. R. ROSE

Pyrogenic oxidation of oil of turpentine in the presence of a copper catalyst. F. ORLOV. *Ukrainskii Khim. Zhurnal* 2, 1-6; *Chem. Zentr.* 1926, II, 660.—When a mixt. of oil of turpentine vapor and air is conducted through a Cu net heated to 400°, the oil is decompd. and oxidized, and the heat of oxidation then maintains the Cu in a glowing condition without external heat being supplied any longer. Among the reaction products were CO , CO_2 and ethylene hydrocarbons, 0.8-21% of water-sol. substances and 60-70% of oil, about 75% of the latter distg. between 160° and 183°. This 160-183° fraction contained cymene, had a pleasant odor and was suitable for use in perfumery. When the mixt. which was passed over Cu was composed of oil of turpentine, air and water vapor, the yield of oil was reduced to 40-50%.

C. C. DAVIS

A few notes on the hydration of nopinene. IV. Comparison of the hydration of pinene and of nopinene. G. AUSTERWEIL. *Bull. soc. chim.* 41, 1088-94(1927); cf. C. A. 21, 1806.—The limonene obtained with the use of heat during the reaction between org. acids and nopinene does not seem to come from pinene formed as an intermediary product. Pinene treated with org. acids yields bornyl esters; the reaction is bimolecular. The isomerization of pinene into limonene is a monomolecular reaction. The velocities of both are smaller than in the case of nopinene treated with the same acids.

A. L. HENNE

The crystalline products formed in the action of aromatic amines on thiosemicarbazide and its derivatives. I. MATZUREVICH. *Bull. soc. chim.* 41, 1065-74(1927).—Partially correcting the conclusions of his first paper (cf. C. A. 21, 2901), M. finds that the products obtained are not derivs. of the 1,2,4,5-tetrazine. The compds. formed in the action of aromatic amines on hydrazodithiocarbamide and its monoaryl derivs. are derivs. of 1,2,4-triazole. They are formed by elimination of a mol. of H_2S . All these compds., except the one m. 297-300° and the one m. 272-3°, crystallize with 1 mol. H_2O , which can be eliminated by drying at 100°, or by a long stay in a desiccator. The 2 exceptions mentioned probably lose their water of crystn. during the drying in the air at room temp. All the compds. are acid. During the titration with an alkali, only 1 H can be replaced by the metal. The K salts are decompd. by CO_2 from the air. The original compds. are regenerated.

A. L. HENNE

Syntheses with azoimide and mechanism of the reactions. F. OLIVERI-MANDALÀ. *Mem. accad. Lincei* [vi], 2, 132-50(1926).—A summary is given of the syntheses effected by addn. of azoimide to compds. with 2 contiguous double linkings in the mol., such as carbodiphenylimide, carbimides and thioarbitimides, ketenes, CS_2 and HNO_2 , compds. contg. bivalent C, such as carbylamines and fulminic acid, the nitrilic linking, the ethylenic linking, and the acetylenic linking, the mechanism of the reaction being discussed in each case.

B. C. A.

Diazohydrates. L. CAMBI. *Atti accad. Lincei* [6], 5, 837-40(1927).—A discussion of the structure of diazohydrates, with special reference to a recent paper by Angeli (C. A. 20, 2991), which is considered epoch-making. The formula $RN(:O)NH$ is most probably that of normal diazohydrates and represents the product which results from the action of excess alkali on diazonium salts, and which can be converted in turn into the corresponding isodiazohydrates. The latter, which form addn. compds. with difficulty or not at all, are represented by the formula $RN:NOH$. No importance is attached to the objection of Hantzsch (C. A. 21, 1970) that the normal formula $RN(:O)NH$ of Angeli does not conform to the structure of the corresponding alkali salts, for the normal diazohydrates when transformed to the salts undergo simultaneously transformation to isodiazohydrates. The discussion leads to the conclusion that the structure of the alkali salts of normal diazohydrates, based on present opinion, is not in any way at variance with the structure of the corresponding free diazohydrates established by Angeli. The structure of the diazohydrates and their salts rests on chem. facts which the stereoisomerism described by Hantzsch neither foresees nor explains.

C. C. DAVIS

The two *p*-nitroazoxybenzenes. A. ANGELI AND D. BIGIARI. *Atti accad. Lincei* [6], 5, 819-23(1927).—Of all the pairs of derivs. of $PhN:N(:O)Ph$, the *p*-nitro derivs. $PhN N(:O)C_6H_4NO_2-p$ (I) and $PhN(O)NC_6H_4NO_2-p$ (II) are most alike in phys. and chem. properties, and they have been difficult to distinguish (cf. Angeli and Alessandri, C. A. 5, 3808). Br was used as a reagent in a new attempt to find a means of readily distinguishing them. I (1 g.) let stand 20 days with excess Br and a little Fe, the excess Br removed with $NaHSO_3$, filtered, the residue refluxed with EtOH, filtered when cold, the residue refluxed in EtOH suspension, cooled, decanted, again refluxed in fresh EtOH, cooled, filtered and recrystd. from C_6H_6 , gave approx. 0.70 g. of tribromo deriv., $C_{12}H_5O_3N_3Br_3$ (III), intense brilliant yellow, m. 206-8° to a brown-yellow liquid, which decomps. at 220°. It is also formed by brominating cold $BrC_6H_4N(:O)C_6H_4NO_2$. From the decanted alc. mother liquors seps. on chilling a flaky substance, which recrystd. from C_6H_6 , yields the compd. $C_{12}H_5O_3N_3$, greenish yellow, m. 150° to an orange liquid. It is doubtless II, formed directly from I. III (0.3 g.) refluxed with Sn (2 g.), concd. HCl (8 cc.) and AcOH (10 cc.) for 0.5 hr., evapd. to a small vol., water added, filtered, the residue recrystd. from ligroin, yields a probable mixt. of 2,4,6- $Br_3C_6H_2NH_2$ and 2,4- $Br_2C_6H_3NH_2$. The acid filtrate concd. after removal of Sn, made alk. with Na_2CO_3 , supersatd. with $(NH_4)_2SO_4$, extd. repeatedly with Et_2O , yields from the Et_2O ext. *p*-phenylenediamine. These reactions show that III is $Br_3C_6H_2N:N(O)C_6H_4NO_2$. Far different results were obtained when II was brominated. Following the same procedure as for I (loc. cit.) there were obtained from 10.8 g. of II after 20 days' standing about 10.7 g. of the compd. $C_{12}H_5O_3N_3Br$, yellow, m. 135-° to an orange-yellow liquid. Expts. to det. whether it is the same as the monobromo deriv. (m. 127°) described by Valori (C. A. 6, 2747) are not completed. The expts. show that I and II may be definitely distinguished by their behavior with Br under the particular conditions described. Expts. on the condensation of *p*- MeC_6H_4CHO (IV) with $PhNHOH$ which were recently described (C. A. 20, 2843) have since been found to have failed merely because the supposed IV was present only in a trace. $PhNHOH$ (1.09 g.) added to IV (1.20 g.) and the cryst. magma purified from EtOH and then from ligroin yields the nitrone *p*- $MeC_6H_4CH:N(:O)Ph$, m. 89-90° to a bright yellow liquid, decomps. 215°, forms IV when boiled with dil. H_2SO_4 , and when fused and recrystd. it changes slowly to the isomeric nitrone, *p*- $MeC_6H_4N(:O):CHPh$.

C. C. DAVIS

***p*-Arsonophenoxyacetic acid.** C. S. PALMER AND E. B. KESTER. *Org. Syntheses* 7, 45(1927).— $p-HOC_6H_4AsO_3H_2$ (218 g.) and 180 g. NaOH in 750 cc. H_2O , treated with 189 g. $ClCH_2CO_2H$ and the mixt. refluxed 4 hrs., then acidified with HCl, give 40-3% of *p*- $HO_2CCH_2OC_6H_4AsO_3H_2$.

C. J. WEST

Spectrochemical studies of hydroxyazo compounds. IV. TAKU UEMURA AND SHOZO TABEI. *Bull. Chem. Soc. Japan* 2, 229-36(1927); cf. C. A. 21, 1801.—Tautomeric transformations may occur when the neutral solns. of the tolueneazocresols are made alk. The dil. neutral solns. of these compds. is generally yellow and becomes deep yellow or orange when the soln. is alk. These tautomers are resp. given as the A (azo)- and R (red)-forms. There is one absorption band when the OH group

in the cresol ring takes the *p*-position with regard to the azo group, and 2 bands when it takes the *o*-position. The Me group has a hyperchromic influence, but when added to an already methylated compd., it ceases to be effective in the absorption curve. So far as the present study is concerned, the position of the Me group seems to have little influence.

A. L. HENNE

Isomers of *p*-hydroxy-3-aminophenylarsonic acid and its acetyl derivative (stovarsol). E. FOURNEAU, J. TREFOUEL, MME. J. TREFOUEL AND G. BENOIT. *Bull. soc. chim.* **41**, 499-514(1927).—2,6- $\text{H}_2\text{N}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{OH}$ is diazotized and treated with Na_2HASO_3 , giving 2-hydroxy-3-nitro-1-phenylarsonic acid, which was reduced to the 3-amino deriv. by NaHSO_3 and in turn acetylated to the 3-acetyl amino deriv. 3-Hydroxy-5-nitrophenylarsonic acid was prepd. similarly from $\text{O}_2\text{N}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{OH}$ and reduced in FeSO_4 soln. to the 5-amino deriv. Aminobenzoxazolone was diazotized and treated with Na_2HASO_3 to form benzoxazolonearsonic acid, which was nitrated to nitrobenzoxazolonearsonic acid. Diazotization of 6,2- $\text{O}_2\text{N}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{OH}$ and treatment with Na_2HASO_3 gave 2-hydroxy-6-nitrophenylarsonic acid, which was reduced to the 6-amino deriv. and this acetylated to the acetyl amino deriv. Some other facts concerning methods of prepn. and properties of other isomers of these acids are given, including 3-hydroxy-2-amino, 4-hydroxy-2-amino, 5-hydroxy-2-amino, 4-hydroxy-3-amino, 6-hydroxy-3-amino, 2-hydroxy-4-amino and 3-hydroxy-4-aminophenylarsonic acids.

R. C. ROBERTS

Triphenylstibine. G. S. HUIERS. *Org. Syntheses* **7**, 80-2(1927).—The PhMgBr from 40 g. Mg, 260 g. PhBr and 800 cc. Et_2O , treated with 114 g. SbCl_3 in 300 cc. Et_2O , gives 82-90% of crude Ph_3Sb .

C. J. WEST

The isomerism of *p*-hydroxyphenylarsonic acid. G. GILTA. *Compt. rend.* **184**, 1073-5(1927).—The diazotization of $p\text{-H}_2\text{NC}_6\text{H}_4\text{AsO}_3\text{H}_2$, with heating of the diazonium compd., and the arsenical fusion of PhOH give isomeric substances (I and II, resp.), the compd. being isolated in each case without passing through the salt. Possibly 1 substance is $p\text{-HOC}_6\text{H}_4\text{AsO}(\text{OH})_2$ and the other is $p\text{-O-C}_6\text{H}_4\text{As}(\text{OH})_2$. I is monoclinic and has $\beta = 92^\circ 17'$ and $a:b:c = 0.4483:1:0.4936$; II also is monoclinic and has $\beta = 91^\circ 4'$ and $a:b:c = 2.4652:1:0.7968$. II changes slowly into I. I gives a monoclinic Ba salt (III), having $\beta = 93^\circ 34'$ and $a:b:c = 1.0535:1:1.1766$; II gives an orthorhombic Ba salt (IV) having $\beta = 90^\circ$ and $a:b:c = 1.4881:1:1.1014$. III changes into IV. Nitration of I gives a NO_2 deriv. (V), large yellow triclinic crystals; nitration of II gives a NO_2 deriv. (VI), fine white needles; either V or VI is 3,4-(NO_2)(HO) $\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$. Dinitration of I and II and nitration of V and VI give 3,5,4-(NO_2)(HO) $\text{C}_6\text{H}_2\text{AsO}_3\text{H}_2$, which is monoclinic and has $\beta = 113^\circ$ and $a:b:c = 1.8272:1:1.6728$. I (II) and V (VI) are used in the manufacture of therapeutic compds., which probably are obtained, therefore, in isomeric forms. The proportions of these may influence the chemotherapeutic index. 3,4-Me(OH) $\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$ also has an isomeric form.

MARGARET W. MCPHERSON

*** Oxidizing action of chloramine-T.** G. SCHIEMANN AND P. NOVAK. *Z. angew. Chem.* **40**, 1032-3(1927).—Oxidation with chloramine-T (I) in acid soln. proceeds similarly as with acidified hypochlorite solns. Oxidation in aq. soln. in the absence of acids or alkalis occurs by virtue of the O_2 liberated by the action of water on I; an initial splitting of NaOCl need not be assumed. I in aq. soln. oxidizes phenanthrenequinone dioxime to the monoxime, and alcs. to the corresponding aldehydes without further oxidation to the corresponding acids. In alk. soln. NaOCl splits off from I, and this soln. therefore has a similar oxidizing action to that of a hypochlorite soln. of like concn. Alk. soln. of I oxidizes benzil dioxime smoothly to diphenylfuroxan.

***p*-Chloromercuribenzoic acid.** F. C. WHITMORE AND GLADYS E. WOODWARD. *Org. Syntheses* **7**, 18-9(1927).—Crude $p\text{-MeC}_6\text{H}_4\text{HgCl}$ (500 g.), oxidized with 720 g. KMnO_4 and 1200 g. NaOH in 18 l. H_2O give 61-74% of crude $p\text{-ClHgC}_6\text{H}_4\text{CO}_2\text{H}$.

C. J. WEST

Anhydro-2-hydroxymercuri-3-nitrobenzoic acid. F. C. WHITMORE, P. J. CULHANE AND H. T. NEHR. *Org. Syntheses* **7**, 1-3(1927).—3-Nitrophthalic acid (211 g.) in 80 g. NaOH and 800 cc. H_2O , treated with 350 g. $\text{Hg}(\text{OAc})_2$ in 50 cc. AcOH and 700 cc. H_2O , heated at $165\text{--}75^\circ$ for 70 hrs., gives 82-90% of anhydro-2-hydroxymercuri-3-nitrobenzoic acid, cream-colored powder. By a similar procedure $\text{C}_6\text{H}_4(\text{CO}_2)_2\text{O}$ gives 85% of anhydro-*o*-hydroxymercuribenzoic acid.

C. J. WEST

Germanium. XVIII. Further organic compounds of germanium. W. R. ORNDORFF, D. L. TABERN AND L. M. DENNIS. *J. Am. Chem. Soc.* **49**, 2512-6(1927); cf. *C. A.* **21**, 540.— Ph_3GeBr is conveniently prepd. by warming Ph_3Ge and Br in $\text{C}_6\text{H}_6\text{Br}$ for a few min.; it m. 134° . Triphenylgermanium chloride, m. $117\text{--}8^\circ$, results from the oxide in dry petrol. ether satd. with HCl , by satg. a soln. of the bromide with HCl or from the oxide and concd. HCl in EtOH . The removal of 2 Ph groups from Ph_3Ge

by Br does not proceed smoothly. Ph_3GeBr and a large excess of $p\text{-MeC}_6\text{H}_4\text{MgCl}$ give triphenyl- p -tolylgermanium, m. $123-4^\circ$. Ph_3GeBr and $p\text{-MeOC}_6\text{H}_4\text{MgBr}$ give triphenylanisylgermanium, m. $158-9^\circ$. Triphenylethylgermanium, m. $75-6^\circ$. Ph_3GeBr and PhNMe_2 do not react; with $p\text{-BrC}_6\text{H}_4\text{NMe}_2$ there results triphenyldimethyl-anilino-germanium, m. $140-1^\circ$; HCl salt, m. $105-10^\circ$ (decompn.). GeCl_4 and PhCH_2MgCl in C_6H_6 give tetra- p -benzylgermanium, m. $107-8^\circ$; soln. in an excess of 25% fuming H_2SO_4 below 35° gives the tetrasulfonic acid, analyzed as the Ba salt. GeCl_4 and Ph_2Hg in C_6H_6 at 140° for 2 days give phenylgermanic acid anhydride, amorphous; the p -tolyl, benzyl and dimethylaminophenyl derivs. were also prepd. Tetra- p -butylgermanium, b₇₃₃ $178-80^\circ$. C. J. WEST

The law of the direct formation of free chlorides by the action of PCl_5 upon phenol-hydroxy-substituted phenol- o -sulfonic acids. RICHARD ANSCHÜTZ AND THEODOR CURTIN. *Ann.* 457, 256-67 (1927).— p -Cresol-6-nitro-2-sulfonic acid (I), yellow, crystg. with $1.5\text{H}_2\text{O}$, m. 84° or, anhydrous, m. 172° ; the following salts were prepd.: NH_4 , golden yellow; Na, yellowish red; K, red needles; Ag, yellow needles; Mg, reddish yellow, with $5\text{H}_2\text{O}$; Ba, carmine-red, with $2\text{H}_2\text{O}$; Ni, dark green, with $5\text{H}_2\text{O}$; Co, red with $6\text{H}_2\text{O}$ or bluish violet if anhydrous. The acid (15 g.) with 15 g. PCl_5 , gently warmed, gives the chloride, yellow, m. $86-7^\circ$; amide, yellowish brown, sinters 205° , decomp. 210° ; anilide, yellow, m. 217° ; p -toluidide, yellow, m. 226° . The acid with excess SOCl_2 gives the anhydride, yellow, m. $158-9^\circ$. AcCl or Ac_2O and the free acid give a resinous mass; but the Na salt and Ac_2O give the Na salt of the p -Ac deriv., which, heated 8 hrs. with PCl_5 , gives p -acetylcresol-6-nitro-2-sulfonyl chloride (II), light yellow, m. 101.5° , also obtained by heating the above chloride with Ac_2O at 120° ; anilide, light yellow, m. 141.5° ; p -toluidide, light yellow, m. 113° . I (10 g.) and 20 g. POCl_3 at $75-80^\circ$ give 1.7 g. 6,6-dinitro-4,4-dimethylphenylene- o -sulfonylchloride, yellowish red, m. 84.5° ; this results in 0.45 g. from II and NH_3 in Et_2O or PhNEt_2 . p -Cresol-2,6-disulfonic acid crysts. with $2\text{H}_2\text{O}$, the anhydrous acid m. 145° ; Ag salt. PCl_5 gives the chloride, which reacts with Ac_2O to give the Ac deriv., m. 116° . p -Cresol-2,6-disulfanilide, m. 231° ; p -toluidide, m. 221° . p -Methylphenylene- o -sulfonylchloride- o , o -disulfanilide, pale red, m. $262-3^\circ$; the p -toluidide, m. $258-9^\circ$. Thus the 2 acids give with PCl_5 the free chloride without the PCl_5 reacting on the phenol hydroxyl. C. J. WEST

Action of potassium carbonate on certain phenyl alkyl ethers. L. C. RAIFFORD AND D. M. BIROSEL. *Proc. Iowa Acad. Sci.* 33, 175 (1926).—An abstract. When a ligroin soln. of Ph isopropyl, isobutyl or isoamyl ether was shaken with dry K_2CO_3 , cryst. products were obtained that were readily sol. in H_2O to give alk. liquids. When dil. acid was used, the corresponding ether was set free. The analyses of these products indicated that 1 at. wt. of K is combined with 2 mol. proportions of ether. So far, no such combinations have been obtained with Li_2CO_3 or Na_2CO_3 . Tests will be made with Rb_2CO_3 and Cs_2CO_3 later. W. G. GAESSLER

p -Dimethylaminobenzophenone. CHARLES D. HURD AND CARL N. WEBB. *Org. Syntheses* 7, 24-6 (1927).— PhNHBz (500 g.), 1025 g. PhNMe_2 and 525 g. POCl_3 give 72% of $p\text{-Me}_2\text{NC}_6\text{H}_4\text{Bz}$; full details of the prepn. are given. C. J. WEST

Derivatives of cumidic and pyromellitic acids. II. HENRI DE DIESBACH AND MARCEL GUHL. *Helv. Chim. Acta* 10, 442-9 (1927); cf. *C. A.* 20, 379.—On passing Cl_2 into the molten acid chloride (I) of β -cumidinic acid (II) (prepd. by action of PCl_5 on 5 g. II) at 150° , toward the end $180-90^\circ$, until there is an increase of 5 g. in wt., there is formed 1,4,2,5- $(\text{CHCl}_2)_2\text{C}_6\text{H}_2(\text{COCl})_2$ (III), m. $110-11^\circ$. By the action of 100% formic acid on III, there is formed 1,4,2,5- $(\text{CHCl}_2)_2\text{C}_6\text{H}_2(\text{CO}_2\text{H})_2$ (IV), which decomp. without m. 270° ; di-Et ester (V), m. 127.5° . V heated to 190° gives off EtCl , forming VI, yellow, m. 263° . By passing Cl_2 into molten I at 150° , heating the resulting chloride with 100% formic acid, crystallizing from AcOH , 1,4,2,5- $(\text{CH}_2\text{Cl})_2\text{C}_6\text{H}_2(\text{CO}_2\text{H})_2$ (VII), is formed which decomp. without m. 325° . Di-Et ester of VII

m. 132° with evolution of EtCl , forming p -pyromellitide. Continued chlorination of I at 265° leads to VIII, m. $267-8^\circ$, which can be crystd. from EtOH without the formation of EtCl , and from AcOH or HCO_2H unchanged. Temp. of chlorination higher than 265° leads to elimination of CO groups. Heating of either p - or m -pyromellitide with PCl_5 at $200-210^\circ$ gives VIII. IX is obtained by heating the normal chloride (X)

of pyromellitic acid with AlCl_3 at 100–110° for 3 hrs., m. 225–7°. Reduction of IX with AcOH and Zn gives *p*-pyromellitimide. D. and G. were able to obtain only two of the three diimides of pyromellitic acid described by H. Meyer and K. Steiner (see C. A. 8, 2365). The normal diimide prepd. by passing dry NH_3 into a benzene soln. of X dissolves in caustic alkali soln., but not in Na_2CO_3 , and sublimes at 300° in vacuum. On passing dry NH_3 into benzene soln. of IX, there forms a ppt. sol. in H_2O . Acidification of the aq. soln. gives 1,4,2,5-(CONH_2)₂ $\cdot\text{C}_6\text{H}_2(\text{CO}_2\text{H})_2$, which when heated above 200° gives the normal diimide.

FREDERICK C. HAHN

Benzanilide. CARL N. WEBB. *Org. Syntheses* 7, 6–7(1927).—Detailed directions are given for the prepn. of PhNHBz from PhNH_2 and BzOH ; the yield of crude product is 80–4%; 20–14% are lost on recrystn.

C. J. WEST

Bromination of α -phenylcinnamic nitrile by the action of light. A. BERTHOUD AND G. NICOLET. *Helv. Chim. Acta* 10, 417–29(1927). The reversible reaction between Br and phenylcinnamic nitrile has been studied in the light and in the darkness. In the darkness the reactions in both directions proceed more slowly than was previously assumed. This is due to the fact that the older expts. were not carried out in complete darkness. The results pertaining to the photochem. reaction are in complete discord with those obtained by Plotnikow (*Lehrbuch der Photochemie*, p. 250). Considered independently of the reverse reaction, the velocity with which Br is added to the nitrile is expressed by the following equations: $d[A\cdot\text{Br}_2]/dt = k_1 I_0^{1/2} [\text{Br}_2]^{1/2}$ for weak absorptions, and $d[A\cdot\text{Br}_2]/dt = k_1 I_0^{1/2} [\text{Br}]$ for total absorption. The thermal coeff. equals 1.4. The photochem. decompn. of the dibromide occurs only in the presence of Br acting as an optical sensitizer. When a large excess of the nitrile is present, the velocity of the reaction is expressed by the following equations: $-d[A\cdot\text{Br}_2]/dt = k_2 I_0^{1/2} [A\cdot\text{Br}_2]/[A] \cdot [\text{Br}_2]^{1/2}$ for a weak absorption, and $-d[A\cdot\text{Br}_2]/dt = k_2 I_0^{1/2} [A\cdot\text{Br}_2]/[A]$ for total absorption. When a large excess of the nitrile is not present, the denominator $[A]$ in the preceding equations is to be replaced by $[A] + m[A\cdot\text{Br}_2]$. The thermal coeff. equals 1.96. The photochem. equil. is independent of the luminous intensity, and is given by the relation $([A] + m[A\cdot\text{Br}_2])[\text{Br}_2]/[A\cdot\text{Br}_2] = K'$, which becomes $[A][\text{Br}_2]/[A\cdot\text{Br}_2] = K$, when a large excess of the nitrile is present.

A. L. HENNE

***p*-Iodobenzoic acid.** F. C. WHITMORE AND GLADYS E. WOODWARD. *Org. Syntheses* 7, 58–9(1927).— $p\text{-ClHgC}_6\text{H}_4\text{CO}_2\text{H}$ (300 g.), slowly added to 150 g. I in 2.5 l. EtOH, give 72–81% of *p*- $\text{IC}_6\text{H}_4\text{CO}_2\text{H}$.

C. J. WEST

2-Bromo-3-nitrobenzoic acid. P. J. CULHANE. *Org. Syntheses* 7, 12–14(1927).—A gently boiling soln. of 50 g. NaOH in 1.5 l. H_2O is treated with 330 g. anhydro-2-hydroxymercuri-3-nitrobenzoic acid (I), the material heated to boiling, 85 cc. concd. HCl added, heating discontinued, 30 cc. AcOH added and then 103 g. NaBr and 160 g. Br in 150 cc. H_2O and the soln. heated to boiling 5 min. after the Br is added; there results 53–61% of 2,3- $\text{Br}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{CO}_2\text{H}$ (based on the 3-nitrophthalic used in the prepn. of I).

C. J. WEST

Beckmann rearrangement of salicylhydroxamic acid derivatives. A. W. SCOTT AND J. H. MOTE. *J. Am. Chem. Soc.* 49, 2545–9(1927).—Salicylhydroxamic acid gives an *Ac* deriv., m. 142° (K salt, decomp. 85°) and a *Bz* deriv., m. 153° (K salt, decomp. 81°). Upon undergoing the Beckmann rearrangement these salts gave hydroxycarbanil instead of a *sym*-disubstituted urea; thus isocyanate is not formed or at least only momentarily.

C. J. WEST

New derivatives of vanillin. G. C. HILMAN AND O. H. ALDERKS. *Proc. Iowa Acad. Sci.* 33, 175(1926).—An abstract. Monobromovanillin was prepd. by Carles (*Bull. soc. chim.* 17, 12(1872)) and further investigated by Tiemann and Haarmann (*Ber.* 7, 615(1874)). More recently, Brady and Dunn (*C. A.* 10, 754) studied the corresponding oxime, which was found to exist in but 1 of the stereoisomeric forms required by the theory. In the present work a dibromo deriv. of vanillin, which has not hitherto been reported, has been prepd. by a method that gives a high yield. The oxime exists in but one form, and the nitrile obtained from it resists hydrolysis to an extraordinary degree. The detn. of the structure of the dibromo compd. is in progress.

W. G. GAESSLER

Reaction of *p*-substituted benzyl chlorides with sodium hydrogen sulfide. CHARLES BARKENBUS, E. B. FRIEDMAN AND R. K. FLEGE. *J. Am. Chem. Soc.* 49, 2549–53(1927).—2-Mercapto-4-methyl-6-hydroxypyrimidine (75 g.) and 12.14 g. Na in 750 cc. abs. EtOH, treated with 80.4 g. *p*- $\text{CNC}_6\text{H}_4\text{CH}_2\text{Cl}$ and heated until the reaction was neutral, gave 86.5% of the 2 *p*-cyanobenzylmercapto deriv., m. 240–1°; hydrolysis with about 10 parts 6 N HCl gives 86% of *p*-cyanobenzyl mercaptan (I), b. 135–8°, m. 37°, having a characteristic garlic odor. I (5 g.) and 5 g. *p*- $\text{NCC}_6\text{H}_4\text{CH}_2\text{Cl}$ in EtONa, re-

fluxed 4 hrs., give 67.7% of *p*-cyanobenzyl sulfide, m. 115°. I (5 g.) and 25 cc. concd. NH_4OH in 100 cc. 95% EtOH give 70.4% of *p*-cyanobenzyl disulfide, light yellow, m. 148°. *p*- $\text{NCC}_6\text{H}_4\text{CH}_2\text{Cl}$ and NaHS give a mixt. of the sulfide and disulfide; if a non-oxidizing atm. is used, only a very small amt. of the mercaptan is formed, the main product being the sulfide. NaSH and *p*- $\text{EtO}_2\text{CC}_6\text{H}_4\text{CH}_2\text{Cl}$ give a mixt. of the mercaptan (impure) and the sulfide, m. 78°. Sapon. of I by boiling with concd. HCl for 3 hrs. gives 89% of *p*-carboxybenzyl mercaptan, m. 176°. *p*-Carboxybenzyl mercaptan, b. 140–1° (74.2% yield). Negative groups such as the NO_2 , CN and CO_2Et in the *p*-position of substituted PhCH_2Cl favor the formation of the sulfide, while the positive Cl favors the formation of the mercaptan.

β -Bromoethylphthalimide. P. L. SALZBERG AND J. V. SUPNIEWSKI. *Org. Syntheses* 7, 8–10(1927).— $\text{C}_6\text{H}_4(\text{CO})_2\text{NK}$ is obtained in 79–89% yields from $\text{C}_6\text{H}_4(\text{CO})_2\text{NH}$ and KOH in EtOH; with $(\text{CH}_2\text{Br})_2$ this gives 69–79% of crude $\text{C}_6\text{H}_4(\text{CO})_2\text{NCH}_2\text{CH}_2\text{Br}$.

C. J. WEST

Ethyl phthalimidomalonate. A. E. OSTERBERG. *Org. Syntheses* 7, 78–9(1927).— $\text{C}_6\text{H}_4(\text{CO})_2\text{NK}$ (165 g.) and 210 g. $\text{BrCH}(\text{CO}_2\text{Et})_2$, heated if necessary to initiate the reaction and finally 1 hr. at 110°, give 67–71% of $\text{C}_6\text{H}_4(\text{CO})_2\text{NCH}(\text{CO}_2\text{Et})_2$.

C. J. WEST

3-Nitrophthalic anhydride. B. H. NICOLET. *Org. Syntheses* 7, 74–5(1927).—3-Nitrophthalic acid (211 g.), gently boiled with 205 g. Ac_2O until soln. results and then for 10 min. longer, gives 88.93% of the anhydride.

C. J. WEST

3-Nitrophthalic acid. P. J. CULHANE AND GLADYS E. WOODWARD. *Org. Syntheses* 7, 70–2(1927).—Tech. $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$ (500 g.) and 650 g. com. H_2SO_4 (d. 1.84), heated to 80°, are treated with 210 cc. fuming HNO_3 (d. 1.51) (temp. 100–100°) and then with 900 cc. concd. HNO_3 , the ppt. of 3- and 4- NO_2 acids is extd. with 200 cc. H_2O and the residue dissolved in 200–300 cc. H_2O , from which crysts. 28–31% of the 3- NO_2 acid.

C. J. WEST

Rearrangement of some ethylenic oxides of general formula $\text{Ph}(\text{CH}_2)_n\text{CHCH}_2\text{O}$.

JEANNE LEVY AND SFIRAS. *Compt. rend.* 184, 1335–7(1927).—I. and S. studied the rearrangement of $\text{Ph}(\text{CH}_2)_n\text{CHCH}_2\text{O}$ to det. the affinitive capacities of the radicals

$\text{Ph}(\text{CH}_2)_n$ with respect to H. It is known that, in the rearrangement of an ethylenic oxide, a rupture occurs between O and the C holding the substituent whose affinitive capacity is the higher. In these cases the rupture occurred as follows: $\text{RCH}_2\text{CHCH}_2\text{O}$

$\text{RCH}_2\text{COCH}_3$. Therefore the affinitive capacities of PhCH_2 -,

$\text{Ph}(\text{CH}_2)_2$ -, $\text{Ph}(\text{CH}_2)_3$ - and $\text{Ph}(\text{CH}_2)_4$ - are lower than that of H. This conclusion, in the case of $\text{Ph}(\text{CH}_2)_2$ -, does not agree with the theory of alternate induced polarity. The homologous hydrocarbons, $\text{Ph}(\text{CH}_2)_n\text{CH}:\text{CH}_2$, were prepd. from $\text{CH}_2:\text{CHCH}_2\text{Br}$ and the Mg derivs. of PhBr , PhCH_2Br , $\text{Ph}(\text{CH}_2)_2\text{Br}$ and $\text{Pl}(\text{CH}_2)_3\text{Br}$. H_2O_2 and the hydrocarbons gave $\text{PhCH}_2\text{CHCH}_2\text{O}$ (I), $\text{Ph}(\text{CH}_2)_2\text{CHCH}_2\text{O}$ (II), $\text{Ph}(\text{CH}_2)_3\text{CHCH}_2\text{O}$ (III), and $\text{Ph}(\text{CH}_2)_4\text{CHCH}_2\text{O}$ (IV). I, II, III and IV are very stable; their rearrangement

is possible only in the presence of a catalyst. I, b₁₇ about 98–100°, gives 40% of a compd. whose semicarbazone, m. 183–4°, is identical with that of PhCH_2COMe . II, b₁₄ 106–9°, gives 30–40% of $\text{Ph}(\text{CH}_2)_2\text{Ac}$, b₂₆ 144–8°; semicarbazone, m. 141°; oxime, m. 88°. III, b₁₆ 122°, gives 35–8% of $\text{Ph}(\text{CH}_2)_3\text{Ac}$ (V), b₁₇ 132–5°, which was prepd. also by sapon. of the ester obtained from $\text{PhC}_2\text{H}_4\text{Br}$ and $\text{AcCH}_2\text{CO}_2\text{Et}$, with decompn. of the acid thus formed; semicarbazone of V obtained by either method, m. 127–8°; oxime, m. 52°. IV, b₁₆ 136–9°, d. 1.013, gives $\text{Ph}(\text{CH}_2)_4\text{Ac}$, b₁₇ 150–3°, which was prepd. also by the method given for V; semicarbazone, m. 136–7°. M. W. MCP.

Oxonium derivatives of carbopyrrotritaric acid. I. TREFILIEV AND A. AISENBERG. *Ukrainskii Khim. Zhurnal* 2, 173–81; *Chem. Zentr.* 1926, II, 2431; cf. *Ukrainskii Khim. Zhurnal* 1, 121.—I in Et₂O added to Na in AcOEt on the water bath and the product treated with 10% H_2SO_4 froms diethyl carbopyrrotritarate, $\text{C}(\text{CO}_2\text{Et})\text{CMe}:\text{O.CMe}:\text{C}(\text{CO}_2\text{Et})$ (I). With Br in CS_2 it forms an addn. compd., unstable bronze-colored crystals, and with I in CS_2 or in C_6H_6 it forms a dark cryst. compd., m. 102–3° (decompn.), very

unstable and contains more than 4 atoms of I per mol. Let stand 24 hrs. with aq. HCl (d. 1.2), I forms *monoethyl carbopyrrolitarate* (II), also formed by the action of concd. HBr. II is probably identical with the crystal compd. which remains after the spontaneous decompn. of the Br addn. compd. of I. With HI, II forms immediately the compd. $C_{12}H_{16}O_6 \cdot 2HI$, dark green, m. $92-3^\circ$ (decompn.), fairly stable in the desiccator, gives a red-brown soln. in C_6H_6 . A fairly stable Br deriv. of I is formed by the action of Br in aq. HBr on I.

C. C. DAVIS

Action on tyrosine and on phenylaminoacetic acid of acetic anhydride and acetone in the presence of pyridine. P. A. LEVENE AND ROBERT E. STEIGER. *J. Biol. Chem.* **74**, 689-93 (1927).—The action of a mixt. of commercial Ac_2O and C_6H_5N (without or with Me_2CO) gives a compd. $C_{14}H_{17}O_4N$, m. $122-3^\circ$, which may be $AcOC_6H_4CH_2CH(N:CMc_2)CO_2H$; the Me_2CO which apparently reacted with the NH_2 group may have been present in the Ac_2O or else formed in the course of the reaction. With 0.66N NaOH the compd. splits off the Ac group, giving the compd. $C_{12}H_{15}O_3N$, m. $163-6^\circ$. $PhCH(NH_2)CO_2H$, similarly treated, gives the compd. $C_{11}H_{13}O_3N$, m. $100-1^\circ$; in this prepn., CO_2 was evolved, so that the 2 formulas, $PhCH_2NAC_2$ and $PhCH(NHAc)Ac$, may be considered for this compd.

C. J. WEST

Benzoylpyruvic ester. H. GAULT AND A. FUNKE. *Bull. soc. chim.* **41**, 473-99 (1927).—Et benzoylpyruvate (I), m. 46° , was prepd. by condensing $PhCOMe$ with $(CO_2Et)_2$ in the presence of NaOEt. Condensation of I with HCHO in presence of NH_4Et in alc. or without solvent gave *Et methylenedibenzoylpyruvate* (II), in the form of a monohydrate, m. 95° , which decompd. when dehydrated. II gave a *diphenylhydrazone*, m. 100° and an *oxime* but no semicarbazone. Sapon. with alkalis or acids decompd. II, forming diphenylpentanedione, m. 62° , $H_2C_2O_4$, and EtOH, proving the constitution of II. Concd. H_2SO_4 removes 2 moles of H_2O from II, giving *methylenebisindonecarboxylic acid*, (IV), m. 170° . IV is unaffected by HCl and alkalis but is oxidized by $KMnO_4$ or $K_2Cr_2O_7$ to $o-C_6H_4(CO_2H)_2$ (V), thus proving its structure. HI does not reduce IV but Na-Hg gives a hydrogenated product, which can be oxidized to IV by HNO_3 . $SOCl_2$ failed to give the acid chloride of IV but a *sodium salt* of IV was prepd. $PhNHNH_2$ gave a *monophenylhydrazone* of IV. The Et ester (VI) of IV was obtained from IV in alc. with HCl gas. Oxidation of this ester gave V. Treatment of II with H_2SO_4 also gave VI. $PhNHNH_2$ gave the *diphenylhydrazone* of VI, m. 150° . $MeCHO$ and I failed to condense either in alc. with Et_2NH or directly. In presence of HCl they condense giving *methylketoparacophenone*, m. 129° , which forms a *Cu salt*, an *anilide*, is unaffected by acids and decomposes in alk. to $MeCHO$, $PhCOMe$ and $H_2C_2O_4$. C_6H_5CHO and I do not condense in alc. but by direct combination give *hexylketoparacophenone*, m. 136° which forms a *Cu salt*, an *anilide*, m. 140° , is unaffected by acids and decomposes in alk. to $PhCOMe$, $C_6H_{13}CHO$ and $H_2C_2O_4$.

R. C. ROBERTS

Chaulmoogramidobenzoic acids and chaulmoogramamides. SIMEONA SANTIAGO AND A. P. WEST. *Philippine J. Sci.* **33**, 265-9 (1927); cf. Herrera-Batteke, *C. A.* **21**, 1449.—The following alkyl anilides were prepd. by heating chaulmoogramide with the corresponding amine: *N-butylchaulmoogramide* (37% yield), m. $100.0-2.5^\circ$; *N-isobutylchaulmoogramide* (45% yield), m. $94.5-99^\circ$; *p-chaulmoogramidobenzoic acid* (14% yield), m. $188-94^\circ$; *o-chaulmoogramidobenzoic acid* (33% yield), m. $80-100^\circ$.

DAVID DAVIDSON

Rearrangement of acid azides and hydroxamic acids of geometrical isomers. LAUDER W. JONES AND J. PHILIP MASON. *J. Am. Chem. Soc.* **49**, 2528-36 (1927).— $PhCH:CHCON_3$ (5 g.), m. 86° , heated in C_6H_6 just below the b. p., gives 3 g. $PhCH:CHNCO$, b. 107° ; the latter, heated in H_2O at 50° gives *syn-distyrylurea*, m. 214° , this also results by the rearrangement of the azide in H_2O ; the azide, heated with C_6H_6 to give the isocyanate and then treated with NH_3 , gives *monostyrylurea* (I), m. 143° . Allocinnamic acid yields an azide which suffered decompn. and rearrangement at room temp.; it gives I with NH_3 . *Crotonyl azide* is a clear liquid with a sharp odor; heated on the H_2O bath and then treated with NH_3 , it yields *isallyl urea*, m. 122° ; the same product was obtained from the azide of isocrotonic acid, which slowly decomp. at $25-8^\circ$. The *K salt* of $PhCH:CHCONHOBz$ rearranges in H_2O , gives a compd., m. 152° , which has not been identified. These results seem to indicate that during rearrangement the configurations of the styryl and isallyl radicals are changed and only the stable *trans* configuration appears in the ureas and undoubtedly, also, in the first products of rearrangement, the isocyanates.

C. J. WEST

α -Cyano- β -phenylacrylic acid. ARTHUR LAPWORTH AND WILSON BAKER. *Org. Syntheses* **7**, 20-2 (1927).— $ClCH_2CO_2H$ (250 g.), 375 g. cryst. Na_2CO_3 and 100 cc. H_2O are treated with 130 g. NaCN in 250 cc. H_2O , the cooled soln. is neutralized with HCl and diluted to 1 l.; 400 cc. of this soln. is added to 5 g. NaOH in 400 cc. H_2O , the soln.

warmed to 40° and treated with 100 g. BzH, giving 65-70% of PhCH:C(CN)CO₂H.

C. J. WEST

Synthesis of *o*-nitrocinnamic acid and the photochemical behavior of this acid. IOAN TANASESCU. *Bull. soc. chim.* **41**, 1074-7 (1927).—This new synthesis gives a 95% yield; 10 g. *o*-O₂NC₆H₄CHO, 15 g. Ac₂O and 5 g. anhydrous AcONa are refluxed at 190° for 16 hrs. After cooling, the mixt. is boiled for a few min. with a concd. Na₂CO₃ soln., then acidified with HCl. The *o*-nitrocinnamic acid (I) crysts. out in a high degree of purity. One recrystn. from alc. is sufficient. A soln. of I exposed to the sun's rays becomes red. The photochem. reaction is very active at the start, but stops rapidly. This is explained by the fact that the green and shorter radiations are responsible for the reaction; the red color of the reaction product (II) rapidly prevents their admission. II can be separated from I by means of its greater soly. in alc. and ether. It does not cryst., but yields a red solid, which becomes soft at about 110° and melts completely at 120°. It exhibits an acid character. Heated above its m. p., it evolves CO₂. It is sol. in concd. H₂SO₄, yielding a brown soln., whereas I yields a blue soln. in the same solvent. II is an isomer of I, and is believed to be *hydroxyisatogenic acid*, with the following formula: C₆H₄CH(OH)C(CO₂H):N(:O).

A. L. HENNE

Diphenic acid. E. H. HUNTRESS. *Org. Syntheses* **7**, 30-3 (1927).—*o*-H₂NC₆H₄CO₂H, diazotized in AcOH and added to a CuOH suspension in dil. NH₄OH, gives 46-57% of diphenic acid.

C. J. WEST

Reduction of benzophenone by magnesium amalgam. Correction. M. GOMBERG AND W. E. BACHMANN. *J. Am. Chem. Soc.* **49**, 2666 (1927); cf. *C. A.* **21**, 579.—That Ph₂CO is not reduced by amalgam that had been prepd. by heating together Mg and Hg is confirmed but a simple mixt. of Mg and Hg at room temp. reduces Ph₂CO. This difference is not as yet explained.

C. J. WEST

***N*-Alkylimines of benzophenone.** MARCEL SOMMELET. *Compt. rend.* **184**, 1338 9 (1927); cf. *C. A.* **20**, 3451.—From Ph₂CCl₂ and RNH₂ were prepd. alkylimines, Ph₂C: NMe (I) in aq. soln. and 4 others in dry C₆H₆N. I, *b*₂₀ 168.5°, m. 47-9°; Ph₂C:NEt (II), *b*_{21.5} 174.5°, m. 61-2°; Ph₂C:NCH₂CH:CH₂ (III), *b*₂₂ 187°, *d*₄²² 1.0475; Ph₂C:NCH(CH₂)₄CH₂ (IV), *b*₁₇ 209-10° *d*₄²¹ 1.0268; Ph₂C:NCH₂Ph (V), *d*₄² 1.0358.

I, II, IV and V give stable methiodides, which are hydrolyzed quant. upon boiling in alc.: Ph₂C:NRMeI + H₂O → Ph₂CO + RNHMe.HI. III has not yet been studied from this point of view.

MARGARET W. MCPHERSON

Ethylideneacetophenone (propenyl phenyl ketone) and β -methoxybutyrophenone. CHARLES DUFRAISSE AND MARCEL DEMONTVIGNIER. *Bull. soc. chim.* **41**, 843-50 (1927).—Condensation of PhCOMe, MeOH and MeCHO in the presence of NaOMe gave β -methoxybutyrophenone (I), *b*₈ 119-21°, *d*₄²⁰ 1.0349, *n*_D²⁰ 1.5168, with some unchanged PhCOMe and variable quantities of decompn. products. Treatment of I with ZnCl₂ gave ethylideneacetophenone (II), m. 20-1°, *b*₉ 111-2°, *d*₁₆ 1.0250, *n*_D¹⁵ 1.5626. Treatment of I with Br in CS₂ gave α,β -dibromobutyrophenone (III), m. 97-8°. II can also be prepd. by reducing III with Fe in alc. slightly acid with AcOH.

R. C. ROBERTS

Catalysts and activated magnesium in the preparation of Grignard reagents. HENRY GILMAN AND J. M. PETERSON. *Proc. Iowa Acad. Sci.* **33**, 173-4 (1926).—An abstract. Many RX compds. enter sluggishly into reaction with Mg in the prepn. of organomagnesium halides. Furthermore, it is actually impossible to form RMgX compds. from some RX compds. Accordingly, a study is in progress on catalysts and activated Mg in order to extend the prepn. of Grignard reagents. The results so far obtained show that when an alloy contg. 12.75% Cu and the remainder Mg is heated in an evacuated tube at 200° for 1 hr. with about 0.5 its wt. of I, the activated alloy thus obtained is superior to that described by Bayer and used so extensively at present. It has been used in a study of the polarity of polyhalogen compds. and the yields of *p*-C₆H₄(MgBr)₂ from *p*-C₆H₄Br₂ are in excess of those obtained by the use of any activated Mg hitherto obtained. The same principle is being successfully employed in the study of organometallic compds. of Be, Ca, Sr and Ba.

W. G. GAESSLER

Problem of ring closure in addition compounds. III. Determination of the configuration of stereoisomeric hydrazones. WALTER HIEBER AND FRITZ SONNEKALB. *Ann.* **456**, 86-110 (1927); cf. *C. A.* **20**, 3251.—Two mol. α -benzilozone (I) in CHCl₃, treated dropwise with 1 mol. SnCl₄ in CHCl₃ gives the dark yellow, non-hygroscopic compd. SnCl₄.I, 2I, decomp. about 145°. Equimol. amts. of I and SnCl₄ give the compd. SnCl₄.I, brick-red powder, m. about 120°; on diln. the concd. red soln. becomes yellow (dissoecn.). Equimol. amts. of the β -osazone (II) and SnCl₄ in CHCl₃ give the bright

red, slightly hygroscopic *compd.* $\text{SnCl}_4 \cdot \text{II}$, m. about 60° ; this is more sol. in indifferent org. compds. than the α -isomer. On the basis of these observations I is considered to be the *syn*-, II the *anti*-form. $\text{SnCl}_4 \cdot 2$ benzalphenylhydrazone, yellow-brown, m. $70-5^\circ$ (decompn.). $\text{SnCl}_4 \cdot 2$ benzophenone phenylhydrazone, red, m. 190° . $\text{SnCl}_4 \cdot 2$ benzalanil, canary-yellow, m. 200° . $\text{SnCl}_4 \cdot \text{benzophenone anil}$, light yellow, m. 180° . $\text{SnCl}_4 \cdot \text{benzil dianil}$, golden yellow, m. 225° ; further addn. of SnCl_4 gives the $2\text{SnCl}_4 \cdot \text{dianil}$, yellow; a red *compd.*, probably $3\text{SnCl}_4 \cdot 2$ dianil, is also formed but was not analyzed. $\text{SnCl}_4 \cdot \text{benzil monoanil}$, light orange, m. 175° ; a red addn. product, $3\text{SnCl}_4 \cdot 2$ benzil monoanil, m. 90° , was also obtained. $\text{SnCl}_4 \cdot \text{benzil monophenylhydrazone}$, brownish red, m. 165° . $\text{SnCl}_4 \cdot \text{tetraphenylpyrazine}$, yellow, decomp. 135° ; with 2 mol. SnCl_4 , the *compd.* $2\text{SnCl}_4 \cdot \text{tetraphenylhydrazine}$, deep red, results. $\text{SnCl}_4 \cdot 2$ diphenyldihydropyrazine, pale yellow, m. 75° . $\text{SnCl}_4 \cdot \text{diphenyldihydropyrazine}$, light orange, m. $115-20^\circ$ (decompn.). Mol. wt. detns. on certain of these compds. are reported. C. J. WEST

Reduction of benzil by the binary system, magnesium + magnesium iodide (or bromide). M. GOMBERG and W. E. BACHMANN. *J. Am. Chem. Soc.* **49**, 2584-92 (1927); cf. *C. A.* **21**, 579.— $(\text{PhC}:\text{O})_2$ in $\text{Et}_2\text{O}-\text{C}_6\text{H}_6$ is reduced by the binary systems, $\text{Mg}-\text{MgI}_2$ and $\text{Mg}-\text{MgBr}_2$, quant. to the *halomagnesium salt* of stilbene diol, $(\text{PhC}(\text{OMgX})_2)_2$; with H_2O benzoin is produced; with acid chlorides esters result; Br and I yield benzil; with O 2 products are formed, benzil and a polymer of the anhydride of benzoic acid. Other binary systems [$\text{Be}-\text{BeI}_2$ (95% yield), $\text{Zn}-\text{ZnI}_2$ (71% yield), $\text{Mg}-\text{Hg}$ (72% yield)] also reduce benzil in a similar manner. The possible mechanism of the reduction is discussed. The reactions with aliphatic-aromatic ketones, aromatic aldehydes and esters towards the binary systems seem to be more complex, though in general of the same nature as described for the ketones. C. J. WEST

Substitution and addition. JAKOB MEISENHEIMER and WALTER SCHLICHENMAYER. *Ann.* **456**, 126-51 (1927).—M. seeks to consider the Walden rearrangement, the abnormal substitution of unsatd. alcs. and chlorides and the *trans*-addn. to C_2H_4 compds. from a general viewpoint. The original should be consulted for the discussion. $\text{Ph}_2\text{C}:\text{CHPh}$ and Br react vigorously in CHCl_3 or CS_2 with HBr evolution; the normal dibromide results only in CCl_4 , m. 95° (70% yield); the solid dibromide slowly decomp. but is stable under lignin. The decompn. in soln. is dependent upon the nature of the solvent; under comparative conditions 60% of the Br is split off in 0.5 hr. in AcOH, 55% in thiophene- C_6H_6 , 20% in ordinary C_6H_6 , 35% in CHCl_3 . From the C_6H_6 soln. there crysts. $\text{Ph}_2\text{C}:\text{CBrPh}$ and $\text{Ph}_2\text{C}:\text{CHPh}$; from EtOH, these 2 and also $\text{Ph}_2\text{C}:\text{C}(\text{OEt})\text{Ph}$, m. 135.5° . Triphenylbromoethylene, m. 115° , is best prepd. from 2 g. $\text{Ph}_2\text{C}:\text{CHPh}$, 0.4 g. Br and 5 cc. CS_2 (yield, 2 g.); with Cl it gives triphenyltrichloroethane, m. 124° . $\text{Ph}_2\text{C}:\text{CPhMe}$ and Br in CCl_4 give triphenylbromopropene, m. 122° ; oxidation gives Ph_2CO and BzCH_2Br ; Br gives 1,1,2-triphenyl-3,3-dibromo-1-propene, yellow, m. 129° , HBr splitting off and the *compd.* then m. 158° ; EtOH gives 1,1,2-triphenyl-3-ethoxy-1-propene, m. 129° , while PhMgBr gives 1,1,2,3-tetraphenyl-1-propene, m. $138-9^\circ$. C. J. WEST

A molecular rearrangement in the naphthylaminesulfonic acid series. A. WAHL and G. VERMEYLEN. *Bull. soc. chim.* **41**, 514-23 (1927).—1,8-Naphthylaminesulfonic acid is converted into its isomer naphthionic acid, when heated for a long time at 90° with concd. H_2SO_4 , the sulfonic group migrating from position 8 to 4. R. C. R.

Supposed isomerism of 9-methylfluoreno. HEINRICH WIELAND and JOSÉ CEREZO. *Ann.* **457**, 249-55 (1927).—The supposed isomer of 9-methylfluoreno (I), m. 84° (*C. A.* **19**, 2334) is now shown to be the *Et ether*; this is also prepd. from the chloride and EtONa. I and BzCl in $\text{C}_6\text{H}_5\text{N}$ give the *O-Bz deriv.*, m. 173° ; *O-Ac deriv.*, m. 75° ; in vacuum it loses AcOH; boiling with EtOH gives the *Et ether*. C. J. WEST

Anthraquinonesulfonic acids. H. E. FIERZ-DAVID. *Helv. Chim. Acta* **10**, 429 (1927); cf. *C. A.* **21**, 1811.—Reply to Wibaut, *C. A.* **21**, 2268. C. J. WEST

Halochromism and deep-colored ketones. R. WIZINGER. *Z. angew. Chem.* **40**, 939-45 (1927).—A review of the literature with 27 footnotes. In the halochromic colors of numerous deep-colored mono- and diketones (indanthrenes, indigo, etc.), the principal chromophore, as in the case of the dye salts, is a coordinated unsatd. central atom in the ionized state. Dilthey's chromophore theory and the new form of the auxochrome theory thus permits the assembling of these compds. into one group, which has not been possible heretofore. C. J. WEST

Relationship between the structure and the biological action of the cardiac glucosides. W. A. JACOBS and ALEX. HOFFMANN. *J. Biol. Chem.* **74**, 787-94 (1927).—Catalytic reduction of 3.5 g. of cymarin (I) gives 2.8 g. hydrocymarin (II), *crystg.* with 1 H_2O , m. 128° (effervescence) and then 190° , $[\alpha]_D^{25}$ 17.8° (c 1.11, $\text{C}_6\text{H}_5\text{N}$); it does not give the nitroprusside reaction; hydrolysis with $\text{MeOH}-\text{HCl}$ gives dihydromonoanhydro-

strophanthidin, m. 226°, $[\alpha]_D^{25}$ 48.5° (c 1.978, C_6H_5N); this also results from dihydrostrophanthidin and dil. MeOH-HCl. Catalytic reduction of ouabain (III) gives the *dihydro deriv.* (IV), amorphous, foams at 105°, $[\alpha]_D^{30}$ -47.4° (c 2.286 in H_2O). *Dihydrodigiloxin*, m. 202-4°, $[\alpha]_D^{25}$ 2.4° (c 0.622, C_6H_5N); on diln. of its EtOH soln. with H_2O it crystals too quickly to permit toxicity detns. The ratio of toxicity of I to II for frogs is 23.3:1, for III to IV, 16.1:1. Thus the biol. action of the cardiac glucosides belonging to the group of unsatd. lactones is a property apparently inherent in the mol. as a whole and the double bond alone does not det. the character but may contribute to the intensity of the action.

C. J. WEST
Constitution of the acids formed in the degradation of cholic acid. W. BORSCHKE. *Z. physiol. Chem.* 169, 306-7 (1927).—Polemical with Wieland (C. A. 21, 2905).

A. W. DOX

The bile acids. XVII. Martin Schenck and Henry Kirchhof. *Z. physiol. Chem.* 169, 164-76 (1927); cf. C. A. 21, 2477.—The ketolactammonocarboxylic acid, $C_{23}H_{43}NO_6$, obtained by vacuum distn. of the isoxime of desoxybilianic acid, when oxidized with $KMnO_4$, yields a *ketolactamdicarboxylic acid*, $C_{23}H_{43}NO_6$, m. 277° (decompn.), without opening of the heterocyclic ring. This reaction corresponds to the oxidation of pyrodesoxybilianic acid to the diketodicarboxylic acid. Bilisoidanic acid, the triketotricarboxylic acid obtained by oxidation of isobilianic acid with 32% HNO_3 , when warmed with dil. NaOH undergoes change from a tribasic to a tetrabasic acid, but on removal of the alkali with excess HCl the acid which seps. is again tribasic but not identical with the original bilisoidanic acid. The first change is believed to be a hydrolysis of 2 adjacent carbonyls into $:C(OH)CO_2H$, a sort of benzoic acid rearrangement, and a transformation of the 6-membered into a 5-membered ring; then when the free acid is liberated from its Na salt, ring closure occurs by lactone formation between a CO_2H and the newly formed OH. The final product is a *tribasic acid*, $C_{21}H_{39}O_8 + 2H_2O$, which sinters 230° and foams 248°. The intermediate tetrabasic γ -hydroxy acid is analogous to cilianic acid, which may conceivably result by benzoic acid rearrangement of an unknown intermediate triketotricarboxylic acid formed when bilianic acid is oxidized.

A. W. DOX

Furan. W. C. WILSON. *Org. Syntheses* 7, 40-1 (1927).—Crude furan-2-carboxylic acid (about 95% pure), heated at 200-5°, gives 72.8% of furan, b_{745} 31-4°. C. J. W.

2-Furylmethyl acetate (furfuryl acetate). MINER LABORATORIES. *Org. Syntheses* 7, 44-5 (1927).—2-Furylcarbinol (600 g.), 225 g. $AcONa$, 650 g. Ac_2O and 1 l. C_6H_6 , heated 4 hrs., give 87.93% of furfuryl acetate.

C. J. WEST

Furfuralacetone. G. J. LEUCK AND L. CEJKA. *Org. Syntheses* 7, 42-3 (1927).—Furfural and Me_2CO , condensed with 33% NaOH at 10°, give 60-6% of furfuralacetone, m. 37.9°.

C. J. WEST

Diphenylthiophene. EMIL FROMM, PAUL FANTL AND EPHRAIM LEIBSOHN. *Ann.* 457, 267-77 (1927).—Steinkopf (C. A. 15, 2870) believed that the 2 diphenylthiophenes, m. 119° and 153°, were identical, because he obtained the same $HgCl_2$ deriv. from each. The following behavior of the 2 derivs. shows them to be 2 different compds. α,α' -Diphenylthiophene (I), m. 153°, obtained in 5-8 g. yield from $PhCH:CHCO_2H$ and S, yields 50% of a *tetrabromo deriv.*, m. 203°. α,β' -Diphenylthiophene (II), obtained in 2-4 g. yield from the same reaction, gives 50-60% of a *tetrabromo deriv.*, m. 150°, if the reaction is carried out in $CHCl_3$; if Br acts on dry II, a compd. m. 245° results, sol. only in CS_2 . I yields a *trinitro deriv.*, yellow, m. 243° (80% yield), while the mother liquors give a *dinitro deriv.*, yellow, m. 189°. II and concd. HNO_3 give a compd., m. 271°, which contains N but a higher S content than II. I gives a *picrate*, ruby red, m. 133-4°; I does not react with picric acid. I, $AcCl$ and $AlCl_3$ give a poor yield of α,α' -diphenylthiophene- β -methyl ketone, m. 214°; the corresponding deriv. from II m. 94°. I does not give a compd. with $HgCl_2$, while that from II, m. 222°. Likewise, I does not react with $Hg(OAc)_2$, while II gives the compd. $C_{16}H_{11}SHgO(OAc)$, m. 207-8°.

C. J. WEST

4-Hydroxypyrazoles and their tautomerism. ALFRED BERTHO AND HANS NUSSEL. *Ann.* 457, 278-307 (1927).— EtO_2CCHN_2 (11.4 g.) and 16 g. $CH_3(CO_2Et)_2$, treated during 2 hrs. with 48 g. $EtONa$, gives 25% of *di-Et 4-hydroxypyrazole-3,5-dicarboxylate*, m. 151°; it gives the enol reaction and a white *Ag salt*; heated with 10 parts 20% HCl 10 min. at 100°, it gives 4-hydroxypyrazole-5-carboxylic acid, m. 204°. Using MeOH in the condensation or heating the Et ester with MeONa gives the Me ester, m. 232°. Similarly EtO_2CCHN_2 and $PhCH(CO_2Et)_2$ with $EtONa$ give 17% of *Et 3-benzyl-4-hydroxypyrazole-5-carboxylate*, m. 169°; the *free acid*, m. 183.5° (decompn.), giving 3-benzyl-4-hydroxypyrazole, m. 157°. *Et 3-isoamyl-4-hydroxypyrazole 5-carboxylate*, m. 115° (42% yield); the *free acid*, m. 186° (decompn.), giving 3-isoamyl-4-hydroxypyrazole,

m. 85°. *Et 3-phenyl-4-hydroxypyrazole-5-carboxylate*, m. 162° (the yield is very small). $\text{EtO}_2\text{CCHN}_2$ and $\text{NCCH}_2\text{CO}_2\text{Et}$ with EtONa give 12% of *di-Et 4-aminopyrazole-3,5-dicarboxylate*, m. 144°; the diazotized ester with $\alpha\text{-C}_{10}\text{H}_7\text{OH}$ gives a red ppt., decomp. 210°. With 10% HCl it gives *4-aminopyrazole-5-carboxylic acid*, m. 212.5°, whose diazo soln. gives a dark red dye with $\alpha\text{-C}_{10}\text{H}_7\text{OH}$. Heated to 220°, the acid gives 4-aminopyrazole. From a study of the reaction of these derivs. it is shown that the esters, especially, are not only tautomeric substances but that in soln. they form an equil. mixt. of keto-enol desmotropes. C. J. Wessr

Comparison of heterocyclic systems with benzene. II. Reduction potentials of quinones containing the pyridine, imidazole, triazole and thiophene rings. L. F. FIESER AND M. A. AMES. *J. Am. Chem. Soc.* **49**, 2604-17 (1927); cf. *C. A.* **20**, 1623.—On comparing the reduction potentials of the quinones of the C_{10}H_8 and $\text{C}_{14}\text{H}_{10}$ series with quinones contg. the 2-phenyltriazole nucleus in place of 1 of the C_6H_4 rings, it is found that a striking similarity exists between this heterocyclic nucleus and C_6H_6 . The 1,2,3-triazole ring is similar to these other 2 and probably has the structure of the 2-Ph deriv., for a quinone contg. the 3-phenyltriazole grouping is much higher in potential than the corresponding triazolequinone or its 2-Ph deriv. The pyridine and imidazole nuclei do not produce a lowering in the potential of quinones to which they are attached which is at all comparable with the effect of a phenylene group. Heterocyclic analogs of anthraquinone do not have the same relation to this substance which the angular isomers bear to phenanthrenequinone. *2-Phenyl-4-amino-5-hydroxybenzotriazole-7-sulfonic acid*, cryst. with $1.5\text{H}_2\text{O}$, results from the 4-NO deriv. in NaHSO_3 soln. Oxidation with 25% HNO_3 gives *2-phenylbenzotriazole-4,5-quinone-7-sulfonic acid*, analyzed as the *K* salt, orange-yellow needles. The acid is decompd. by alkalis, and with concd. H_2SO_4 evolves SO_2 ; it is readily reduced by SO_2 and condenses with amines; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$ gives *2-phenyl-7-(p-toluidino)-benzotriazole-4,5-quinone*, dark red, m. 215°. *1-Phenyl-4-benzeneazo-5-hydroxybenzotriazole*, bright red, could not be reduced to the amine. α,β -*Naphthimidazole-4,5-quinone*, orange, does not m. 250°. The normal reduction potentials of a no. of quinones are tabulated. C. J. Wessr

Preparation of fisetol. P. KARRER AND H. BIEDERMANN. *Helv. Chim. Acta* **10**, 441 (1927).—In contradistinction with Sater and Stephen (*C. A.* **14**, 1966), the authors were unable to detect the formation of any 5-hydroxycoumarone as a by-product in the synthesis of fisetol. They report the exptl. details by which 12 g. fisetol, m. 189°, is obtained from 10.5 g. glycolic nitrile and 19.3 g. resorcinol. These 2 compds. are dissolved in 120 cc. abs. Et_2O with a trace of ZnCl_2 . The soln. is satd. with HCl gas, the imide hydrochloride filtered, washed with Et_2O , covered with H_2O , heated for 2 hrs. on the water bath, and allowed to crystallize. Fisetol is characterized by its phenylhydrazone, m. 107-9°. A. L. HENNE

Xanthydrol. A. F. HOLLEMAN. *Org. Syntheses* **7**, 88-9 (1927).—Xanthone is reduced by Na-Hg to xanthydrol, the yield being 91-5%. C. J. Wessr

Xanthone. A. F. HOLLEMAN. *Org. Syntheses* **7**, 84-6 (1927).—*o*- $\text{HOC}_6\text{H}_4\text{CO}_2\text{Ph}$ (500 g.), heated to 275-85° (at which point PhOH distills) and the heating so regulated that the temp. of the vapors never exceeds 175° (preferably below 170°), gives after 6-7 hrs. 220-25 g. PhOH ; further distn. gives 61-3% xanthone. C. J. Wessr

Differential cleavage of the carbon to carbon linkage by alkali metals. J. B. CONANT AND B. S. GARVEY, JR. *J. Am. Chem. Soc.* **49**, 2599-603 (1927).—The action of Na-K alloy, 40% Na-Hg and 1% Na-Ig on a no. of substituted dixanthyls and certain ethanes has been studied. By using these reagents in C_6H_6 or Et_2O one can differentiate between certain compds. which contain a reactive C-C linkage. The rate of cleavage by Na-K alloy is essentially the same for a no. of substituted dixanthyls and dixanthyl itself. This is probably due to the fact that with this powerful reagent a phys. process controls the rate of the heterogeneous reaction. Dimethyldixanthyl gives *methylxanthanoic acid*, m. 205.6°; *Me ester*, m. 96-7°. *Ethylxanthanoic acid*, m. 173-4°; *Bu deriv.*, m. 144.5° (*Me ester*, m. 73-4°); *benzyl deriv.*, m. 232° (*Me ester*, m. 103-4°). C. J. Wessr

Synthesis of β -acid (2,6-dihydroxyquinoline-4-carboxylic acid) obtained from "Roh-Oryzanin" by hydrolysis. YOSHIKAZU SAHASHI. *Proc. Imp. Acad.* **3**, 437-8 (1927).—The outline of the method of this synthesis is given; details will appear in *Biochem. Z.* C. J. Wessr

Unsymmetrical phenanthridones. II. New preparation method: 7-nitrophenanthridone by Beckmann rearrangement of 2-nitrofluorenone oxime. F. J. MOORE AND E. H. HUNTRESS. *J. Am. Chem. Soc.* **49**, 2618-24 (1927); cf. *C. A.* **21**, 1987.—Fluorenone oxime with PCl_5 undergoes a normal Beckmann rearrangement, yielding phenanthridone. Oximation of 2-nitrofluorenone yields mainly, if not entirely, 1 of

2 possible stereoisomers, m. 262.5–3°; Beckmann rearrangement gives 90% of 7-nitro-phenanthridone, a Cl product (an equil. between the oxime chloride and its rearrangement product?) being an intermediate step, which is converted into the desired NO₂ deriv. by boiling with PhCl, AcOH or 50% H₂SO₄. C. J. WEST

A new synthesis of the acridones. I. TANASESCU. *Bull. soc. chim.* **41**, 528–37 (1927).—The prolonged action of concd. H₂SO₄ on 2,4-(O₂N)₂C₆H₃CHO in C₆H₆ gave 2-nitro-5-keto-5,10-dihydroacridine (I) and an ether of dinitrobenzohydrol, m. 167°. Treatment of I with PhNMe₂ and POCl₃ gave 2-nitro-5-dimethylaminophenylacridine, m. 225°, which was identical with the product obtained from the acridine made by Ullman with the same reagents. Using PhCl, PhBr and PhMe, resp., in place of C₆H₆ above gave 2-nitro-5-keto-5,10-dihydro-8-chloroacridine, 2-nitro-5-keto-5,10-dihydro-8-bromoacridine and 2,4-dinitro phenyl-di-p-tolylmethane, m. 280° (decompn.). Reactions of this type are general ones and are explained by assuming that o-O₂NC₆H₄CHO exists in 2 tautomeric forms. These condensations are being studied further.

R. C. ROBERTS

Action of piperidine on various α-bromo-α,β-ethylenic ketones. CHARLES DUFRAISSE AND HENRI MOUREU. *Bull. soc. chim.* **41**, 850–62(1927).—Piperidine (I) reacts with α-bromoanisalacetophenone to give piperidinoanisalacetophenone, m. 75.5–6.5°. I and α-bromomesityl oxide or dibromomesityl oxide gave mesitylpiperidino oxide, b₁₀ 101°, n_D²⁰ 1.4710, d₄^{19.5} 0.9395. The dibromide of phenylvinyl ketone and I gave dipiperidinomethylacetophenone, m. 71–3°. I and the dibromide of ethylideneacetophenone gave dipiperidinoethylacetophenone, m. 113.5–4.5°, which is hydrolyzed by H₂SO₄ to propionylbenzoyl and α-piperidinoacetophenone. I and α-bromothylideneacetone gave a piperidine product which is hydrolyzed by H₂SO₄ to acetylpropionyl and piperidinoacetone. α-Bromobenzalacetophenone and alc. NH₃ gave α-amino-benzalacetophenone, m. 95–7°, which gives a hydrochloride, m. 184° and a hydrobromide, m. 189° and is hydrolyzed by acid to phenylglyoxal.

R. C. ROBERTS

β-Pyridyl-α-pyrrolidine (nornicotine). MAX AND MICHEL POLONOVSKI. *Compt. rend.* **184**, 1333–5(1927); cf. C. A. **21**, 1654.—Ac₂O and I, the N-oxide of nicotine, give acetylnornicotine (II), thick oil, α_D –13.6° (c 4.32%, C₆H₆). II gives with acids uncrystallizable acid salts, decomposed by H₂O; the picrate and the chloroaurate are oily. Bz₂O and I give benzoylnornicotine (III), thick oil. Sapon. of II or III gives nornicotine (IV), CH:CH.CH:N.CH:CCH(CH₂)₃NH. IV is a readily oxidizable oil,

b₁₀ 150–5°, α_D –20° (c 3.87%, MeOH). IV gives an oily NO deriv. and an oily urea deriv. IV gives neutral and acid salts, mostly uncrystallizable; picrate, yellow, m. 135°; the mono- and di-HCl salts are easily decompd. by heat; chloroaurate, m. 210–2° (decompn.).

MARGARET W. MCPHERSON

Quinazolines. XXXVIII. Synthesis of some new analogs of cinchophen and intermediate products. MARSTON TAYLOR BOGERT AND EUGENE MILLER MCCOLM. *J. Am. Chem. Soc.* **49**, 2650–4(1927); cf. C. A. **18**, 2900.—o-(o-Nitrobenzoylamino)acetophenone (I), m. 156° (78% yield); m-nitro deriv., m. 170° (78% yield); o-salicylaminoacetophenone, m. 135° (59% yield); o-(p-acetoxybenzoylamino)acetophenone, m. 97.5° (75% yield); hydrolysis gives the p-hydroxy deriv., m. 219° (90% yield). Oxidation of I with alk. KMnO₄ gives o-nitrobenzoylisatinic acid (II), which was not purified nor analyzed because of its instability; salicylisatinic acid, yellow, m. 209–10° (decompn.) (90% yield); p-hydroxybenzoylisatinic acid, m. 209–10°. Crude II and NH₃ in abs. MeOH heated at 140° for 10 hrs. give 2-(o-nitrophenyl)quinazoline-4-carboxylic acid, m. 235° (still not pure); the 2-(o-hydroxyphenyl) deriv., yellow, m. 171°; Et ester, yellow, m. 115°; the 2-(p-hydroxyphenyl) deriv., yellow, m. 251°; Et ester, yellow, m. 159°. The above m. ps. are cor.

C. J. WEST

Alkaloid trichloroacetates. Use of trichloroacetic acid in toxicology. G. FLORENCE. *Bull. soc. chim.* **41**, 1097–1100(1927).—CCl₃CO₂H should replace H₂SO₄ for the isolation of the alkaloids in a toxicological investigation, because H₂SO₄ is likely to destroy digitalin, cocaine and atropine. New trichloroacetates have been prepd. from several bases. In the following table, the org. base used, the number of H₂O mols. of crystn. and the soly. in H₂O at various temps. in % are recorded successively. Aniline, 1, S₅₅ = 33.21, S₁₅ = 3.28; o-toluidine, 1, S₅₄ = 43.3, S₁₅ = 7.2; p-toluidine, 1, S₅₇ = 38.4, S₁₅ = 2.7; strychnine, 3, S₅₅ = 20.75, S₁₅ = 4.03; brucine, 3, S₅₅ = 25.25, S₁₅ = 4.02; morphine, 3, —; codeine, 2, S_{54.5} = 23.71, S₁₅ = 2.81; quinine, 4, S₅₅ = 29.98, S₁₅ = 3.43; quindine, 3, —. The trichloroacetates of cocaine, nicotine, atropine and cinchonine are easily prepd., but it was impossible to obtain crystals. All the trichloroacetates are sol. in EtOH, Me₂CO, insol. in benzene or ligroin. Boiling H₂O has a tendency to cause the

evolution of CHCl_3 and CO_2 , together with the pptn. of the basic radical.

A. L. HENNE

Yohimbine. A. SCHOMER. *Arch. Pharm.* **265**, 509-24 (1927).—The present study embodies the main results obtained in an investigation on yohimbine (I) (Dissertation, Marburg, 1927). The initial material examd. was a sample of I-HCl "Gehe," the isolated base of which m. 231° and gave values on analysis agreeing fairly well with the formula $\text{C}_{20}\text{H}_{28}\text{O}_3\text{N}_2$, proposed by Spiegel (cf. *Ber.* **37**, 1904), although its HCl salt (as also the HBr and HI derivs.) more nearly corresponded to the compn. $\text{C}_{21}\text{H}_{28}\text{O}_3\text{N}_2$, corroborative evidence of which has also been furnished by Ellen Stedmann (cf. *C. A.* **21**, 2133). Of the three O atoms in I 2 are believed to function as a methylated carboxyl group, the 3rd as hydroxyl, which latter cannot, however, be phenolic in character because of the insoly. of I in aq. alkali. Since I yields with Ac_2O and AcONa a cryst. *di-Ac deriv.*, m. 183° , and an amorphous *mono-Ac deriv.*, m. 150° , it follows that in the former a secondary N atom must be engaged. Solns. of the amorphous deriv. show green fluorescence; they yield no cryst. salts except an aurate. Attempts to split the I ring by oxidation, reduction, exhaustive methylation *via* Hofmann, treatment with CNBr , etc., all gave negative results. The behavior of I toward CNBr points to the presence of a tetrahydroquinoline ring in the mol. Reduction of I in abs. alc. soln. with Na, in accordance with the expression $\text{C}_{19}\text{H}_{23}\text{ON}_2 \cdot \text{CO}_2\text{CH}_3 \rightarrow \text{C}_{19}\text{H}_{23}\text{ON}_2 \cdot \text{CH}_2\text{OH}$, gave *yohimbyl alcohol*, crystg. with 2 mol. of H_2O and m. 148.9° (202° after loss of H_2O by drying at 105°); *HCl salt*, $\text{C}_{20}\text{H}_{28}\text{O}_2\text{N}_2 \cdot \text{HCl}$, $[\alpha]_D^{20}$ 37.5° (1 g.:50 cc. $\alpha_D = 0.75^\circ$ (1-dm. tube)); *methiodide*, m. 215° .

STEWART, A. W.: **Recent Advances in Organic Chemistry**. Vols. I and II. 5th ed. London: Longmans, Green & Co., Ltd. 387 pp. and 382 pp., resp. 21s. each vol. •

Acetic acid. H. DREYFUS. *Brit.* **262,832**, June 13, 1925. Equimol. proportions of CO and H are passed under pressures of 50-200 atm. and at temps. of $200-300^\circ$ or somewhat higher (but under 450°) over substances such as Cu oxide, Sn oxide, Pb oxide, Cu acetate, Al methylate, Sn methylate or their mixts. Cf. *C. A.* **21**, 3368.

Acetic acid. P. A. SMITH and H. G. SMITH. *Can.* **273,715**, Sept. 6, 1927. Alkali acetate is produced by leading methanol vapor under pressure in presence of H_2 under pressure over a molten alkali formate at $200-300^\circ$.

Acetic acid. STOCKHOLMS SUPERFOSFAT FABRIKS A.-B. *Swed.* **62,474**, March 1, 1927. AcH is oxidized with O_2 or air with or without the aid of a catalyzer. The reaction components are brought together in stills filled with solid diluents in order to avoid explosions.

Anhydrous salts of lower fatty acids. H. VON HOCHSTETTER. U. S. **1,645,265**, Oct. 11. Anhyd. esters such as EtOAc are caused to react with NaOH or other anhyd. hydroxides in the presence of org. solvents such as anhyd. EtOH .

Benzoic acid from phthalic anhydride. COURTNEY CONOVER. U. S. **1,645,180**, Oct. 11. A mixt. of H_2O vapor and phthalic anhydride vapor is subjected to the action of a catalyst such as ZnO .

Lead compound of thioglycolic acid. E. LYONS. U. S. **1,644,258**, Oct. 4. A compd. of the formula $\text{Pb}(\text{SCH}_2\text{COONa})_2$ is obtained by treating thioglycolic acid with $\text{Pb}(\text{OH})_2$ in the presence of Na_2CO_3 and pptg. with MeOH and ether. It is of golden yellow color, sol. in H_2O and alk. to phenolphthalein and is of low toxicity.

Arylamides of 2,3-hydroxynaphthoic acid. BRITISH SYNTHETICS, LTD. AND E. B. HIGGINS. *Brit.* **262,958**, Dec. 28, 1925. Arylamides of 2,3-hydroxynaphthoic acid are

made by interaction of 2,3-hydroxynaphthoyl chloride and aromatic amines not contg. electronegative substituents in the presence of a weak alkali by mixing the reacting materials in various specified methods and orders. The reaction temp. should not exceed about 60°.

Calcium salts of inositol-phosphoric acid. A. GAMS and M. GIRARD. U. S. 1,645,233, Oct. 11. Compds. of inositol-phosphoric acid of the formula $C_6H_{12}O_{27}P_6X$ (in which the 12 H atoms represented by X are substituted wholly or in part by Mg) are caused to react, under acid conditions, with Ca compds. such as $CaCl_2$ which are sol. in the reaction medium and whose anion yields with Mg a salt sol. in dil. alc.

Calcium salts of inositol-phosphoric acid. A. GAMS and M. GIRARD. U. S. 1,644,246, Oct. 4. Compds. of inositol-phosphoric acid of the formula $C_6H_{12}O_{27}P_6X$ (in which the 12 H atoms represented by X are substituted wholly or in part by Mg) are treated with alkali metal hydroxide and the alkali compds. thus formed are treated with $CaCl_2$ or other Ca compds. of sufficient soly. to effect reaction. The Ca salts thus formed are pptd. by alc.

Cyclohexyl ester of phthalic acid. F. F. REID AND G. L. SCHWARTZ. U. S. 1,543,393, Sept. 27. Esters of phthalic acid in which the H of one COOH group is substituted by the cyclohexyl group and the H of the other COOH group by an open-chain alkyl or an aryl radical such as cyclohexyl *n*-butyl phthalate, are formed by heating phthalic anhydride with cyclohexanol and then with *n*-BuOH or other component.

Esters of mixtures of adipic acids. W. CLAASEN. U. S. 1,643,619, Sept. 27. Hydrogenated crude cresols are oxidized, *e. g.*, by boiling HNO_3 of 1.2 sp. gr., to form mixts. of adipic acids and the acid mixt. is esterified *e. g.*, by treatment with EtOH and gaseous HCl, without preliminary sepn. of the mixt. into its components. The products are colorless and sweet smelling.

Acid amides. P. A. SMITH and H. G. SMITH. Can. 274,065, Sept. 20, 1927. $AcNH_2$ is produced by passing a mixt. of MeOH vapor and HCN over a catalyst at a high temp.

Ethyl ether. K. E. SKARBLUM. Swed. 61,991, Nov. 23, 1926. EtOH vapor is passed over hydrated Al_2O_3 at a temp. below that necessary for the production of C_2H_4 alone. Cf. C. A. 21, 917.

Methane. F. KLATTE and J. SÖLL. U. S. 1,643,663, Sept. 27. A current of gases contg. CO and H is treated with a Ni catalyst at a temp. above 500° and the velocity of flow of the gases is regulated to avoid sepn. of C and quickly to remove the gases from the hot reaction zone.

Conversion of methane into hydrocarbons. G. OLIVIER. Can. 274,783, Oct. 18, 1927. CH_4 is converted into hydrocarbons of higher C content by leading an annular stream of CH_4 of very small thickness through zones of gradually increasing temps., the products formed being subjected to a vacuum and suddenly cooled as they come out of the hottest zone.

Acetaldehyde. W. O. HERRMANN and H. DEUTSCH. Can. 274,219, Sept. 27, 1927. AcH is produced by causing C_2H_2 to react upon H_2O in the presence of Hg compds and acid, adding solvents for the C_2H_2 , and working under an excess pressure up to 3 atms.

Solid formaldehyde-containing composition. SKÅNSKA ÄTTIKFÄBRIKEN. Swed. 62,763, April 13, 1927. CH_2O is mixed with one or more bivalent water-sol. alcs. or corresponding aldehydes, ketones, hydroxy aldehydes or hydroxy ketones.

Urea and formaldehyde product. A. GAMS and G. WIDMER. Can. 274,266, Sept. 27, 1927. Condensation products are obtained from urea or urea derivs. and CH_2O , the condensation being conducted in presence of active C and at ordinary temp. in order to obtain dimethylolurea. The active C is eliminated by filtration and the filtrate evapd. at low temp.

Aldehyde resins. W. O. HERRMANN, H. DEUTSCH and W. HAEHNEL. U. S. 1,643,496, Sept. 27. Non-phenolic aldehyde resins such as those prepd. from AcH or crotonaldehyde are treated with org. hydroxy-carboxylic acid compds. such as ricinoleic or dihydroxystearic acid, or castor oil, to improve the color, elasticity, soly. and fusibility.

Tetra-ethyl lead. H. W. DAUDT, A. E. PARMELEE and WM. S. CALCOTT. U. S. 1,645,375, Oct. 11. In effecting reaction between $EtCl$ and mono-sodium-lead, there is added to the reaction mass, subsequent to the completion of the reaction, a dispersing substance such as Turkey red oil, C_6H_6 glue, agar-agar or lard oil which is adapted to form a H_2O -insol. film on the surface of the particles of the mass, which serves to facilitate handling and sepn. of Et_4Pb by distn.

Tetra-alkyl lead compounds. K. P. MONROE. U. S. 1,645,389, Oct. 11. Pb ,

associated with an element such as Na capable of liberating H from H_2O , is treated with EtBr or other alkyl halide in the presence of a catalyst of the type used for the Grignard synthesis, and H_2O is added to the reaction mass to cause reduction of the complex first formed to dialkyl Pb; the latter is thermally decomposed into tetra-alkyl Pb. U. S. 1,645,390 specifies treating 1 atomic proportion of Pb, alloyed with not more than 2 atomic proportions of an element such as Na capable of liberating H from H_2O , with an alkyl halide and H_2O together with another substance such as EtOH capable of increasing the miscibility of the H_2O in the liquid phase of the reaction mixt.

Alcohols. G. PATART. Can. 273,983, Sept. 20, 1927. A method for the synthetic production of higher-mol. org. compds. contg. O consists in reducing CO by H_2 in the presence of a catalyzer and under high pressure. The products thus obtained are condensed and the methanol and other compds. having a lighter mol. wt. than the higher compds. to be produced are sep'd. from the condensates. The methanol and other compds. are again subjected to a catalytic reduction under high pressure. Cf. C. A. 21, 1128.

Alcohols. G. PATART. Can. 273,984, Sept. 20, 1927. A method of synthesizing higher alcs. consists in subjecting a mixt. of C oxides and H_2 at a high pressure and temp. to the action of a catalyzer formed of a very intimate mixt. of 30% ZnO and 70% neutral K_2CrO_4 by wt. Cf. C. A. 21, 1128.

Hydrocarbon. A. MITTASCH, M. PIER, R. WIETZEL and H. LANGHEINRICH. Can. 273,685, Sept. 6, 1927. Aromatic hydrocarbons are produced by heating cycloparaffins and naphthenes with a catalyst comprising active charcoal and a compd. of a metal of the 6th group of the periodic system.

Light hydrocarbons by catalytic hydrogenation of oxygen-containing compounds. D. FLORENTIN, A. KLING and C. MATIGNON. Brit. 263,082, Dec. 17, 1925. Compds. such as phenol, cresols, phenolic oils, derivs. of cyclohexanol, shale oils and vegetable and animal oils are treated with H (with or without the presence of CO or hydrocarbon gas) at 350–480° in the presence of dehydrating catalysts such as thoria, Al_2O_3 and SiO_2 . $AlCl_3$ also may be used in some instances.

Hydrazo compounds. R. A. NELSON and A. PRASIL. U. S. 1,644,483, Oct. 4. In order to sep. hydrazanisole or other hydrazo compds. from admixt. with ZnO residues and alc., the alc. is directly distd. off and the hydrazo compd. is extd. from the residue by use of C_6H_6 or other solvent immiscible with H_2O .

Reducing nitro compounds. R. A. NELSON and A. PRASIL. U. S. 1,644,484, Oct. 4. In the formation of hydrazobenzene from $PhNO_2$ or in other similar reductions of nitro compds., the latter, in soln. in C_6H_6 or other org. solvent immiscible with H_2O , are reduced with Zn and caustic alkali (an excess of Zn is employed over that required to form zincate with the caustic alkali).

Production of acids, oils, alcohols, etc., from organic materials. J. H. WALLIN. Swed. 63,605, Aug. 30, 1927. The org. materials are heated under pressure with a soln. of caustic alkali, with or without the addn. of alkali carbonate. A sufficient excess of alkali is used to neutralize all the acid formed. The temp. should be not less than 250° with an at least corresponding pressure.

Iodination process. C. RATH. Can. 274,178, Sept. 27, 1927. Pyridine derivs. are treated with I or substances furnishing I in the presence or absence of solvents and in faintly alk. or neutral medium with the coöperation of substances, such as the alkali salts of weak acids like CO_2 or H_3BO_3 , capable of combining the HI liberated.

Vanillin. R. H. BORS. U. S. 1,643,804, Sept. 27. $PhNO_2$ is used for the oxidation of isoeugenol or other compds. having a C_6H_5 nucleus and a lateral chain $CH:CH-CH_3$ to produce corresponding aldehydes. U. S. 1,643,805 specifies a similar process, in which a K compd. of isoeugenol may be used with $PhNO_2$ and aniline and an excess of NaOH.

Dinitrotoluene. BRITISH DYESTUFFS CORPORATION, E. H. RODD and R. W. EVERATT. Brit. 263,018, May 12, 1926. Dinitrotoluene setting at temps. below 20° is obtained by nitrating a mixt. of mononitrotoluenes contg. less than 45% *m*-nitrotoluene, crystg. the product, and sepg. the liquid fraction from the solid. The temp. for the crystn. varies with the proportion of *m*-nitrotoluene in the starting material and may be about 18–25° with a mixt. of mononitrotoluenes contg. 33% *m*-nitrotoluene.

Aminoanthraquinone. D. G. ROGERS. U. S. 1,644,494, Oct. 4. An anthraquinonesulfonic acid is heated with aq. NH_3 in the presence of an org. nitro compd. such as $PhNO_2$ and of an NH_4 salt, e. g., NH_4Cl .

***dl*-Nerolidol.** L. RUZICKA. U. S. 1,644,546, Oct. 4. *dl*-Nerolidol, a colorless liquid, b_p 145°, having a faint "odor of flowers" and convertible by chromic acid into farnesal, whose semicarbazone m. 133°, is obtained by treating the Na compd. of the

α,β -dihydropseudoionone with C_6H_5 and reducing the methylethynylhomogeranyl-carbinol so formed.

Anthraquinone-nitrosamine compound. H. TESCHÉ and A. JOB. U. S. 1,643,428, Sept. 27. Anthraquinonenitrosamine compds. of the general formula, $C_{14}H_7O_2-N.NO.R$, in which R is an alkyl, aralkyl or aryl radical, e. g., *N*-nitroso-2-methylaminoanthraquinone, are made by reacting with a HNO_2 compd., e. g., with $NaNO_2$ in the presence of glacial HOAc at a temp. of about 40° or lower, on 2-methylaminoanthraquinone or other compds. of the general formula $C_{14}H_7O_2-N-H.R$.

2-Hydrazino-5-nitropyridine. C. RATH. Can. 274,179, Sept. 27, 1927. 2-Hydrazino-5-nitropyridine is produced by reaction of 2-halo-5-nitropyridine with $N_2H_4.H_2O$.

FRANK P. UNDERHILL

The influence of temperature on the optimal hydrogen-ion concentration for amylolytic action. H. LUEKS and S. NISHIMURA. *Wochschr. Brau.* 43, 415-6(1926).—The work of Olsen and Fine could not be confirmed. A soln. of sol. starch buffered with acetate-acetic acid mixt., which had a p_H range of 3.5 to 6, was converted by an amylase prepd. according to Sherman and Schlesinger. Within a temp. range of $15-70^\circ$ the optimum p_H was found to vary from 4.4 to 4.6. B. C. A.

The crystallization of starch. H. L. VAN DE SANDE-BAKHUYZEN. *Proc. Soc. Exptl. Biol. Med.* 23, 506-7(1926).—Alc. was added to amylose soln. and let stand at 100m temp. for 3 weeks; spherocrystals, built up of radial needles, were in the ppt. C. V. B.

The problem of the decomposition of grape sugar in the animal organism. A. ALEKSEEV. *Bull. Univ. Aise centrale* (Taschkent) 10, 39-49; *Chem. Zentr.* 1926, II, 256.—To prove the existence of *reductase* and *carboxylase* in animal tissues, the evolution of CO_2 from lactic acid solns. treated and neutralized with tissue ext. was studied: $MeCH(OH)CO_2H \rightarrow MeCOCO_2H + AcH + CO_2$. The evolution of CO_2 was very small when the ext. had previously been boiled. By addn. of methylene blue to the unboiled ext. it was considerably increased. The aq. ext. from beef liver and muscle was most active at p_H 7.0. Aq. exts. of ox lung and brain, sheep liver, muscle and lung and fresh human liver were tested. Since lactic acid plays an important part in the decompn. of glucose, the expts. show unmistakably the importance of *reductase* and *carboxylase* in internal respiration processes. C. C. D.

Expressed juices of organs. I. The nucleoprotein content of expressed juices. II. Investigations of the formation of expressed juices, with special reference to the influence of the pressure used for expressing the juice on the composition of the latter. G. GRUND and H. JASTROWITZ. *Z. exptl. Med.* 48, 365-80, 381-91; *Chem. Zentr.* 1926, II, 1964.—An investigation of the phys.-chem. condition of the cell substances was made with the special object of detg. whether finely dispersed and coarsely dispersed components are distinguishable and can be sepd. To this end organs were ground fine with diatomaceous earth and forced through linen cloth under high pressure. In the expressed juice and in the organ pulp, albumin, globulin, neutral fat, cholesterol, phosphatides, cholesterol esters and nucleoprotein P were detd. by known methods. There were significant differences between the analyses of the organs and the expressed juice (calcd. on a basis of wet substance) which allowed certain definite conclusions. The substances which are present in the highest proportions in the expressed juice must be in colloidal soln., and substances which are not present in the juice but which are present in high proportion in the organs must be in coarse suspension or in the gel form. The latter is true of the nucleoproteins. To det. the influence of the pressure on the compn. of the expressed juices, juices from the same source but prepd. under different pressures were analyzed. The results show that with increasing pressure (from 75 to 300 atm.) the concn. of dissolved protein in the juices decreased as soon as a gel was present in the pressed pulp. This was confirmed by sep. expts. with grape sugar solns., gelatin, etc., and is attributed to changes in the size of the pores of the diatomaceous earth under pressure. The phenomena are simpler with crystalloids, for the analyses of the juice give a fairly accurate representation of

the conditions existing in the organs. A distinct increase of NaCl in the juice with increasing pressure was, however, noted. C. C. DAVIS

The reversibility of enzyme reactions. I. The breakdown and synthesis of uric acid. ST. J. PRZYŁECKI. *Ann. physiol. physicochim. biol.* 3, 381-421(1927); cf. C. A. 21, 2508.—From *in vitro* expts. with hashed mammalian liver, P. concludes that the breakdown of uric acid in the living organism is irreversible. The action continues until all of the uric acid disappears. The presence of allantoin in excess does not retard the rate of destruction of the uric acid, and no synthesis occurs when one uses uricase with allantoin. The synthesis of uric acid by uricoligase (an enzyme in the hashed liver of birds) was also found to be irreversible. The synthesis does not depend on the liver itself as it occurs with the ground tissue to which CHCl_3 or toluene has been added. The latter enzyme is also present in the juice expressed from the liver of birds and some invertebrates. The synthesis is brought about by an enzyme since the potency of the liver prepn. is destroyed by boiling. When uricase is added to the tissues which are synthesizing uric acid, there is a decrease in the rate of formation or a breakdown of the existing uric acid. H. J. DEUEL, JR.

The physiological importance of inositol. JOSEPH NEEDHAM. *Ergebnisse physiol.* 25, 1-45(1926).—A review contg. an historical outline, and covering the distribution, chemistry, methods of detn., bacteriology, and relation to enzymes of *i*-inositol. Its relation to phytin and phytase is discussed as well as the metabolism of inositol in plants and animals, the latter both under physiol. and pathol. conditions. A crit. analysis of the 4 theories of its physiol. significance is given. N. believes in common with Starkenstein that inositol exists in the animal body as phytin but disagrees with S. by insisting that it must have a very important function. Its appearance in urine in various polyurias cannot be explained by a simple washing out of the tissues. When it is synthesized it must originate from glucose. Synthesis must be possible in the human to explain the continued excretion of as much as 20 g. daily over long periods of time. H. J. DEUEL, JR.

The occurrence, the cycle and the metabolism of iodine. TH. VON FELLEBERG. *Ergebnisse physiol.* 25, 176-353(1926).—A comprehensive review. H. J. D., JR.

The importance of radioactivity for the animal life. H. ZWAARDEMAKER. *Ergebnisse physiol.* 25, 535-73(1926).—A review. H. J. DEUEL, JR.

John Newport Langley. RENÉ DU BOIS-REYMOND. *Ergebnisse physiol.* 25, xv-xix(1926).—An obituary containing a splendid portrait of Langley. H. J. D., JR.

William Maddock Bayliss. F. H. STARLING. *Ergebnisse physiol.* 25, xx-xxiv(1926).—An obituary contg. a complete list of his published articles. H. J. D., JR.

Cozymase. XIV. Purification experiments. HANS V. FÜLER AND KARL MYRBÄCK. *Z. physiol. Chem.* 169, 102-22(1927); cf. C. A. 21, 3205.—The cozymase contained in the filtrate from boiled yeast was subjected to pptn. by various reagents for the purpose of purification. Increase in purity was ascertained by detg. the no. of cozymase units in each prepn., the unit being the amt. required to give a fermentation velocity of 1 cc. CO_2 per hr. when added to a specified mixt. of cozymase-free yeast, glucose and phosphate buffer. Starting with dried yeast H, which had a cozymase value of 300 units per g., the first operation was dialysis through collodion whereby proteins, glyco-gen and yeast gum were removed. The dialyzate was treated with neutral $\text{Pb}(\text{OAc})_2$ and the ppt. discarded. The filtrate was then made alk. after addn. of more $\text{Pb}(\text{OAc})_2$, the ppt. contg. cozymase was washed and the Pb removed by H_2SO_4 . The activity had now been increased to 2000-6000 units. Removal of phosphates and certain other impurities can also be effected by $\text{Ba}(\text{OH})_2$ or Mg mixt., but these reagents have no advantage over the $\text{Pb}(\text{OAc})_2$. Losses sustained in the purification treatment cannot be accounted for by a possible sepn. of cozymase into sep. components, since the sum of the activities of the fractions is always equal to the activity of the mixt. Fifty % EtOH removes certain impurities from the crude prepn., after which further addn. of EtOH to 70% ppts. cozymase with a purity of 3500. HgCl_2 does not ppt. cozymase, but $\text{Hg}(\text{NO}_3)_2$ gives a ppt. from which the cozymase may be recovered by removing the Hg by H_2S . In this way the $\text{Pb}(\text{OAc})_2$ prepn. with purity of 3000 was increased to 10,000. Further purification to 15,000 was accomplished by pptn. with HgSO_4 in neutral soln., whereas AgNO_3 and $\text{Ba}(\text{OH})_2$ treatment of the same prepn. gave a purity value as high as 20,000. Ammoniacal AgNO_3 gave in one instance a prepn. with purity of 55,000. The highest purity of all was attained by the use of silicotungstic acid in the presence of H_2SO_4 , which increased the value to 77,000 units per g. Other reagents which either failed to ppt. cozymase or gave only an insignificant increase in purity with considerable loss of material in the filtrate were PtCl_4 , AuCl_3 , Cu salts and picric acid. The Krüger method for pptg.

purines probably ppts. cozymase but the expts. were not conclusive. A prepn. with purity of 30,000 gave the following analysis: C 40.05, H 4.86, N 24.39, S 1.54, ash 9.46. P and amino N were absent. A 2% soln. showed no optical activity, and no biuret, Millon or ninhydrin reaction. The Molisch reaction for carbohydrate was intense, as also the phloroglucinol reaction for pentose, and the nitroprusside reaction. The murexide reaction was doubtful, and the Kossel reaction for purines, the pyrrole reaction and the diazo reaction were negative.

A. W. Dox

Biological disintegration and respiration processes with various groups of substances. HANS V. EULER, RAGNAR NILSSON AND DAGMAR RUNEIJELM. *Z. physiol. Chem.* 169, 123-63(1927).—The methylene blue reduction, so useful in many oxido-reduction studies, and the taking up of mol. O by enzymic material are not parallel processes. The velocity of methylene blue reduction should not be regarded as a measure of total respiratory power. It is especially adapted for the measurement of the anaerobic phase of carbohydrate break-down and of many other important processes. According to the authors' working hypothesis an enzymic degradation is effected by the so-called reductases, the process leading to more easily oxidizable substances. The mol. O respiration of these substances proceeds through the agency of oxidation catalysts which act to some extent like peroxidase. Concerning the activity of cozymase as a "respiratory body" the view is expressed and supported by expts. that the respiration of cozymase is not directly activated but the activation of respiration is brought about by the participation of cozymase in the dismutation-like transformation of glucose. Measurements of the O consumption of succinic acid showed that a succinodehydrogenase soln. can lose its respiratory power while its reducing action on methylene blue remains unimpaired and can be activated by addn. of succinate. A far-reaching parallelism was found between the cytochrome content of yeast and the respiratory power. When the cytochrome was in any way inactivated, whether by drying of the yeast or by poisoning with HCN, the respiration was inhibited no matter if the reductase remained entirely intact as shown by methylene blue expts. Of course, oxidation catalysts other than cytochrome might have participated, which on drying of the enzyme material or on addn. of HCN, are destroyed in the same manner as cytochrome. In attempts to use methylene blue as an artificial oxidation catalyst, respiratory activation was attained in the absence of natural oxidation catalysts by addn. of methylene blue. No conclusions can be drawn regarding oxidation velocity from oxidation potential alone. Lactic acid is attacked by yeast reductase without cozymase.

A. W. Dox

Peroxidase. V. **Mathematical consideration of the enzyme action.** H. W. BANSI AND H. UCKO. *Z. physiol. Chem.* 169, 178-95(1927); cf. *C. A.* 21, 1465.—The oxidation of pyrogallol by peroxidase proceeds according to the exponential equation, $u = k \cdot t^{1/a}$, where u = conversion, t = time, k = const., and the exponent represents the tangent of the angle of inclination of a bilogarithmic line. $1/a$ varies with the magnitude of the Freundlich adsorption isotherm between 0.3 and 1.0. $1/a = 1$, as an ideal limit, represents the linear course of the time-conversion equation; $1/a = 0.5$ represents the case of the Schütz rule for pepsin digestion. The exponential factor is dependent on the reaction of the medium and on the H_2O_2 concn. It expresses the retardation of the reaction. The decrease in reaction velocity is caused by adsorption of the enzyme on the purpurogallin formed.

A. W. Dox

Comparative investigations on the action of alkali, acids and enzymes on proteins, peptones, polypeptides, 2,5-diketopiperazines and substances of related structures. EMIL ABDERHALDEN AND HERBERT MAHN. *Z. physiol. Chem.* 169, 196-222 (1927).—The work described is part of an extensive investigation in which it is planned to study the effect of acid and alkali at various concns. and temps. on polypeptides contg. different combinations of amino acids and with different lengths of the chain, and on amino acid anhydrides and proteins. It has previously been shown that 2,5-diketopiperazines are hydrolyzed more easily by alkali than by acid. Expts. with *dl*-leucylglycine now show that this dipeptide is unaltered by *N* HCl at room temp. and slowly hydrolyzed at 70-5° and at 100°. *N* NaOH has no effect at room temp., but at 50-5° a slow hydrolysis and at 100° a rapid hydrolysis occurs. 2 *N* and 4 *N* NaOH act slowly at room temp. The corresponding anhydride is slowly hydrolyzed by 0.1 *N* NaOH at room temp. and rapidly by *N* alkali. *N* HCl at room temp. gives practically no hydrolysis, but hydrolysis occurs at 50-5° and more rapidly at 70-5°. The effect of *N* alkali and acid on a 10% soln. of elastin in *N* HCl was followed by means of detns., at stated intervals, of amino N, optical rotation and rotation of the Cu salts. The acid treatment resulted in a fairly uniform decrease in rotation, a change in rotation of the Cu salts from *d* to *l*, and a steady increase in amino N. The alkali

treatment had much the same effect except that the rotation of the Cu salts diminished without changing direction. After prolonged digestion of elastin with pepsin and 0.1 N HCl the effect of N NaOH was practically the same. A. W. DOX

Spectrophotometric comparison of natural with synthetic thyroxine. EMIL ABDEH-HALDEN and ERNST ROSSNER. *Z. physiol. Chem.* 169, 223-5(1927).—The spectrophotometric curves of natural thyroxine and of thyroxine prepd. by Hoffmann-La Roche by the Harrington and Barger synthesis coincide in all respects, indicating the identity of the 2 products. A. W. DOX

The adaptation of fresh culture yeasts to galactose. H. v. EULER and BRITA JANSSON. *Z. physiol. Chem.* 169, 226-34(1927).—Yeast does not acquire the property of fermenting galactose when the preliminary treatment with galactose is given in the presence of just sufficient PhOH to inhibit cell growth. Likewise an adaptation does not occur when cell growth is inhibited by a temp. of 38°. Adaptation to galactose is apparently a function of cell growth. When once acquired the adaptation is retained by the yeast even after drying. The change is in the zymase complex and not in the cozymase, since cozymase obtained from yeast either before or after adaptation is equally effective in activating the fermentation of galactose by adapted yeast from which the cozymase has been removed. A. W. DOX

The chemistry of the blood pigment. VII. Behavior of the prosthetic group in various solvents. FELIX HAUROWITZ. *Z. physiol. Chem.* 169, 235-62(1927); cf. C. A. 21, 3628.—The spectra of hemin, mesohemin, dimethylmesohemin and etiohemin and the corresponding hemochromogens were detd. in the presence and absence of cyanides and pyridine. In pyridine soln. the spectrum of the hemin is clearly distinguishable from that of the hemochromogen. The trimethylated product obtained by methylation of monomethylhematin with Me₂SO₄ contains additive MeOH in the unsatd. side chains; the FeOH group could not be methylated. The Cl atom of hemin is present as anion in all of the solvents investigated. In acid soln. the pigment residue migrates as a cation, and hemin is thus [RH]⁺Cl⁻. In alk. soln. both Cl and H are released by disocn., thus H⁺-[R]⁺Cl⁻. This occurs also when both CO₂H groups are esterified, so that a 3rd CO₂H must also be present in hemin. The action of HCN on Cl-hemin is similar to that of pyridine and PhNH₂. A compd. is formed which splits off HCl when poured into aq. AcOH, giving rise to de(HCl)hemin or hydroxyhemin. By the action of the bases pyridine and PhNH₂ the pigment residue becomes a cation, by the action of HCN an anion, and a complex linkage of the residues is probable. Pyridine acts on oxyhemoglobin with cleavage to globin, O₂ and pyridine-hemochromogen; on methemoglobin with cleavage to globin and pyridine-hydroxyhemin. A. W. DOX

Furan compounds derived from sugars. JUNJI KARASHIMA. *Z. physiol. Chem.* 169, 278-96(1927).—Hydroxymethylfuroyl chloride, b_p 120°, was prepd. in 88.9% yield by refluxing hydroxymethylpyromucic acid with SOCl₂. Condensation of this with glycine by shaking in the presence of N NaOH at a low temp. gave 40.2% of hydroxymethylpyromucuric acid m. 182°. Feeding expts. were made with several furan derivs. to det. the form in which the substances are eliminated. Chitose was excreted in the form of hydroxymethylpyromucic acid by rabbits, dogs, chickens and frogs, but only in small quantity, the max. recovery being 6.3%. Hydroxymethylfurfural gave the same product in 43.7-66.7% yield. Chitonic acid was administered subcutaneously as the Na and Ca salts and the original substance recovered to the extent of 8%, but no hydroxymethylpyromucic acid was found. Chitonic acid was recovered in only one case and then only 1%, and no hydroxymethylpyromucic acid found. A. W. D.

Amygdalase, gentiobiase, gentianase. KARL JOSEPHSON. *Z. physiol. Chem.* 169, 301-4(1927).—Discussion of a theoretically possible mode of detg. whether gentianase is identical with amygdalase or with gentiobiase. A. W. DOX

The action of suprarenal tissue upon lecithin. H. C. W. VINES. *Endocrinology* 11, 224-8(1927).—The incubation of dried suprarenal tissue in a saline medium (0.6% NaCl, 0.2% NaHCO₃, and 0.1% glucose) at p_H 7.4 and 37° with lecithin (0.5 g. per 100 cc. solvent) caused a lipolysis of lecithin. This effect was increased in the presence of cholesterol and cholesterol esters were formed. Choline is probably attacked since HCOOH was found in the distillate. It is suggested that the side chain of the adrenaline mol. may be derived from choline. H. J. DEVEL, JR.

The influence of certain colloids upon fermentation. R. GRIEG-SMITH. *Proc. Linnean Soc. N. S. Wales* 52, Pt. 2, 17-24(1927); cf. C. A. 20, 3207.—Heating yeast to nearly the lethal temp. caused inversion of sucrose to take place, but the mineral colloid did not affect the invertase which is assumed to be responsible for the action. The invertase of normal yeast is adsorbed by the colloid. Alcoholic fermentation of

sucrose by heated yeast is accelerated by mineral colloids, and the rate of fermentation of dextrose by normal yeast is increased by fuller's earth. Small quantities of agar depress while large quantities accelerate the fermentation of invert sugar.

C. N. FREY

Investigation of hydrogenase. J. GRÜSS. *Wochschr. Brau.* 43, 265-8(1926).—The following butyric acid organisms were used in this investigation: *B. butyricus*, *E. amylocymicus*, *B. levans* and *B. corticalis*. These organisms produce H during fermentation. (1) glucose \rightarrow $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOH} + 2\text{CO}_2 + 2\text{H}_2$; (2) glucose \rightarrow $\text{CH}_3\text{CHOHCOOH}$; (3) glucose \rightarrow $\text{HCOOH} + \text{CH}_3\text{COOH} + \text{CH}_3\text{CH}_2\text{COOH}$; (4) glucose \rightarrow $\text{CH}_3\text{COOH} + (\text{CH}_3\text{COOH})_2 + \text{C}_2\text{H}_5\text{OH} + \text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OH} + \text{HCOOH} + \text{CO}_2 + 2\text{H}_2\text{O}$; (5) glucose \rightarrow $2\text{CH}_3(\text{CH}_2)_4\text{COOH} + \text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{COOH} + 4\text{CO}_2 + 4\text{H}_2\text{O}$. H was absorbed by Pd foil either by placing it in the soln. or outside of the fermenting soln. The Pd foil is then placed in a measured violamine soln. (tetramethyl-*p*-phenyldiamine-HCl) which has been oxidized. If H is present the violamine soln. is decolorized. Free mol. H does not act on violamine. Therefore Pd acts as a catalyst: $\text{Pd} + (\text{H}_2)_2 = \text{Pd} + n\text{H}_2 = \text{PdH}_{2n}$, $\text{PdH}_{2n-2} + \text{VO} = \text{H} + \text{II} + \text{VO}$, $2\text{H} + \text{VO} = \text{H}_2\text{O} + \text{V}$. (V = violamine.)

C. N. FREY

The diastase content of grains. STAIGER. *Z. Spiritusind.* 50, 173(1927).—Diastase content in terms of Lintner for various samples of rye, barley and wheat is given. One sample of barley had a Lintner of only 17 and a sample of rye had 106°, the highest in the group.

C. N. FREY

Placental hormone (feminin). E. GLIMM AND F. WADEHN. *Klin. Wochschr.* 6, 999-1000(1927); cf. *C. A.* 21, 1280.—A placental hormone has been prepd. which contains 1 mouse unit of activity in 0.006 mg. of material. The substance is a pale-colored oil, sol. in ether and in dil. alkalies. The method of prepn. is described in detail.

MILTON HANKE

Reversal of the anion permeability of erythrocytes to one of an elective permeability for cations, by alkalization. RUDOLF MOUND. *Klin. Wochschr.* 6, 1432(1927).—Blood cells are known to be electively permeable to anions. This can be changed so that the cells become electively permeable to cations by alkalization of the suspension medium to p_{H} 8.0 to 8.3.

MILTON HANKE

The behavior of adrenal lipase toward poisons and the clinical importance of this behavior. M. N. CHEBOKSAROV AND Z. J. MALKIN. *Klin. Wochschr.* 6, 1472-4(1927).—Adrenal lipase is resistant toward quinine, strychnine, cocaine, tartar emetic, Na salicylate, ext. of belladonna and diphtheria toxin. It is inactivated by atoxyl and chloral hydrate.

MILTON HANKE

Physicochemical explanation of the normal bone-formation, formation of crystalline deposits in disease and the influence of alkalies on the metabolism. N. R. DHAR. *Z. anorg. allgem. Chem.* 162, 243-50(1927).—The mechanism of the normal bone-formation is plausibly explained as follows: $\text{Ca}_3(\text{PO}_4)_2$ and CaCO_3 in the body are chiefly present as colloids. These colloids are adsorbed by the solid $\text{Ca}_3(\text{PO}_4)_2$ and CaCO_3 of the bones, and coagulated. The ppt. thus obtained acts as a coagulation agent toward the sols of Ca salts, and consequently the ppt. increases gradually. The decrease of the bone-formation in old age can be explained by assuming that the colloids of the body acquire a high peptization power; this would be connected with the loss of water occurring in old age. Dead tissues and foreign substances act as a nucleus in the adsorption and coagulation of little sol. sols like CaCO_3 , $\text{Ca}_3(\text{PO}_4)_2$, urea, CaC_2O_4 , etc.; the formation of ppts. depends on the concn. of the body colloids, which act as peptization agents. The OH ions accelerate the metabolism and are of high importance in the treatment of many diseases. The citrate ions stabilize milk and blood; they do so by increasing their elec. charges.

A. L. HENNE

The iodine content of the thyroid in the Japanese fetus, newborn child and at the age of puberty. T. NOSAKA. *Folia endocrinol. japon.* 2, 1-17(1926); *Ber. ges. Physiol. expil. Pharmacol.* 41, 99.—I is detectable in the fetal thyroid from the 6th month on and increases with progressing age first gradually, then at puberty rapidly. The wt. of the thyroid is lower, the I percentage higher than in the European. The water content is lower in the adult gland.

MARY JACOBSEN

The formation of fats by microorganisms. G. SELIBER. *Monographs Sci. Inst. in honor of P. E. Lesgaft, I Leningrad (Russia)* 1926, 1-110.—The monograph takes up the subject of fats in algae, bacteria and fungi; the methods of chem. analysis of fat, the cultivation of fat-decomposing organisms, microchem. reactions, extn. of fat, the constns. which characterize fats, reactions showing the decompn. of fat in microbial culture, fat-decomposing microorganisms and the nature of fat decompn. by micro-

organisms. It also deals with the decompn. of fats and the formation of carbohydrates and of adipocere in dead bodies.

J. S. JOFFE

The treatment of acid and alkali burns. E. C. DAVIDSON. *Ann. Surgery* **85**, 481-9(1927).—Concd. acids react with the skin promptly. With increased diln. there is a striking prolongation of the latent period. Concd. HCl is much less caustic than concd. HNO₃ or H₂SO₄. NaOH and KOH react only after prolonged latent periods. Treatment with water is better than through neutralization. The latter should be used only after most of the caustic has been removed by the water.

FRANCES KRASNOW

Behavior of pyrimidine derivatives in the organism. AMANDUS HAHN AND W. HAARMANN. *Z. Biol.* **85**, 275 9(1926).—Yeast ext transforms 5-methylcytosine to thymine as well as cytosine to uracil. Isocytosine and 4-methylisocytosine are not attacked by yeast.

FRANCES KRASNOW

The thermodynamics of temperature changes in collagen. EDGAR WOHLISCH AND RENÉ DU MÉSNIL DE ROCHEMONT. *Z. Biol.* **85**, 406-34(1927).—The changes are endothermic and are reversible.

FRANCES KRASNOW

The physiological chemistry of fibrinogen. II. Solubility and acid-combining properties in physiological salt solution. EDGAR WOHLISCH AND JACOB SCHLOSS. *Z. Biol.* **85**, 542-50(1927); cf. *C. A.* **18**, 3610.—Minimum soly. is obtained at p_H 4.46. On both sides of this fibrinogen can bind H ion.

FRANCES KRASNOW

The nature of the combination between certain acid dyes and proteins. R. A. GORTNER. *J. Biol. Chem.* **74**, 409-13(1927).—A recent paper by Chapman, Greenberg, and Schmidt (*C. A.* **21**, 1822) contains data which they interpret as indicating that certain conclusions reached by Hoffman and Gortner (*C. A.* **19**, 2961) are in valid but these data appear to be capable of an exactly diametrically opposite interpretation and as such offer striking substantiation of the conclusions of H. and G. The stoichiometrical reactions between the proteins and dyes used in their expts are not necessarily reactions between primary valences but may be regarded as entirely an electrokinetic phenomenon as claimed by H. and G. The originals should be consulted.

A. P. LOTHROP

The iron content of animal tissues. C. A. ELVEHJEM AND W. H. PETERSON. *J. Biol. Chem.* **74**, 433-41(1927).—The following percents of Fe were found in certain fresh beef tissues: bone marrow 0.0009, brain 0.0023, heart 0.0811, hide 0.0047, intestine 0.0034, kidney 0.0055, liver 0.0083, lung 0.0122, pancreas 0.0060, spleen 0.0089, muscle round steak 0.0041, muscle T-bone steak 0.0037. The % of Fe in rabbit tissues is of the same order of magnitude. A no. of analyses of spleen, liver and kidney taken from different animals are given and give valuable information regarding the relative value of these tissues in the cure and prevention of anemia. The % in beef, calf and hog liver, resp. is 0.0083, 0.0054 and 0.0250; in beef, calf and hog spleen 0.0091, 0.0255 and 0.0294. Beef juice prepd. in the same way as for infant feeding contains only 0.0029% of Fe.

A. P. LOTHROP

The nature of enzymes. K. G. FALK. *J. Am. Leather Chem. Assocn.* **22**, 508 21(1927).—An address.

H. B. MERRILL

Studies of proteins. X. The density and the optical rotatory power of albumin solutions. HANS JØRSEN-HANSEN. *Compt. rend. trav. lab. Carlsberg* **16**, No. 10, 20 pp.(1927).—The influence of the concn. and of the H-ion concn. on the densities and rotatory power of albumin solns. has been studied. The multiplicity of the data are not amenable to abstracting.

J. H. PERRY

Ultra-violet absorption spectra of certain physiological fluids. M. C. REINHARD. *J. Gen. Physiol.* **11**, 1-6(1927).—Ultra-violet absorption curves are given for human bile from post-mortem examn., human saliva, pericardial fluid, and urine, uric acid, albumin, pseudoglobulin, euglobulin, hemoglobin and blood serum. The app. and method are described in detail.

C. H. R.

Kinetics of the swelling of cells and tissues. J. H. NORTHROP. *J. Gen. Physiol.* **11**, 43-56(1927).—The rate of swelling of *Arbacia* eggs (Lillie, *C. A.* **10**, 1786; Lucke and McCutcheon, *C. A.* **20**, 2512), and of slices of potato or carrot (Stiles and Jørgensen, *C. A.* **12**, 1205) may be expressed, resp., by equations previously derived (cf. Northrop, *C. A.* **21**, 3295) for the rate of increase in vol. of a soln. enclosed in a collodion sac, and for the swelling of blocks of gelatin.

C. H. R.

Some aspects of bioelectrical phenomena. W. J. V. OSTERHOUT. *J. Gen. Physiol.* **11**, 83-99(1927).—Single cells have a no. of advantages over tissues for the study of bioelec. phenomena. The structure of protoplasm is discussed in relation to bioelec. phenomena and it is shown that measurements of p. d. can be used under certain circumstances to det. what ions enter protoplasm. The p. d. across the cell protoplasm

can be ascertained at single points instead of being measured only as the difference between 2 points. C. H. R.

Diastatic hydrolysis of melezitose and of turanose. M. BRIDEL AND TH. AAGAARD. *Bull. soc. chim. biol.* 9, 884-907(1927).—Turanose was not hydrolyzed by almond emulsin, rhamnodiastase or the sucrase of top yeast, but was readily hydrolyzed by a maceration of air-dried bottom yeast which contains α -glucosidase. Accordingly turanose is an α -glucoside of fructose formed by a union of 1 mol. of fructose and 1 mol. of glucose obtained by the dil. acid hydrolysis of melezitose. Melezitose is not hydrolyzed by the sucrase of yeast. Almond emulsin hydrolyzed melezitose very slowly in a manner undetd. In comparing the action of hydrolyzing powders obtained from *Aspergillus niger* on sucrose and melezitose it is seen that it is not the same enzyme which causes the hydrolysis of these sugars. The maceration of air-dried bottom yeast hydrolyzes melezitose to glucose and fructose and the hydrolysis is arrested on account of the rapid destruction of the α -glucosidase which acts on the turanose portion of the mol. The non-reduced hexobiose formed in the course of this hydrolysis is at once decompd. by another enzyme existing in the maceration. The exact nature of the non-reducing glucofructose existing in the melezitose mol. is not known. I. W. RIGGS

Protection of catalase against anticatalase by ethyl alcohol. S. R. ZUBKOWA AND E. M. RIAKHINA. *Compt. rend. soc. biol.* 97, 524-5(1927).—Alc. added to a mixt. of catalase and anticatalase and distd. gave no trace of aldehyde in the distillate. The mechanism of this action is not explained. L. W. RIGGS

Nature of albumins measurable by "error of proteins." R. GOFFON AND R. HAUDUQUET. *Compt. rend. soc. biol.* 97, 570-1(1927); cf. C. A. 21, 3642.—Only the complex albumins require an appreciable quantity of acid for the error of protein reaction. Com. peptones have only 0.1 the action of egg albumin. It is possible that the index given by peptones is due to other factors than the error of protein, and that they act as a salt of a weak acid. It is difficult to measure the HCl index of error of protein because of flocculation which interferes with a comparison of the tints. CO_2 -globulin gives a very slight index of error of protein. With colloidal pseudo-solns. such as starch paste or gum arabic the phenomenon of error of protein does not occur. L. W. RIGGS

The cytochrome, an intracellular respiratory pigment common to microorganisms, plants and animals. D. KEILIN. *Compt. rend. soc. biol.* 97, No. 24, Appendix 39-70 (1927).—A description of cytochrome and its relation to other org. pigments is followed by a discussion by several members of the Soc. Biol. The résumé and conclusions, in 22 paragraphs, fill 2 pages. L. W. RIGGS

Salts of α -linolic tetrabromide (Cd, Co, Cu, Mg, Mn) from Philippine lumbang oil. C. M. JOVELLANOS AND A. P. WEST. *Philippine J. Sci.* 33, 349-56(1927).—Lumbang oil is obtained from seeds of *Aleurites moluccana*. It is a drying oil suitable for paints, varnishes and similar products. Alpha-linolic tetrabromide was first prepd. by the method of Santiago and West. This after purification m. 112.3-114.3°. The K salt of this acid was prepd. and an alc. soln. of this salt was treated with an alc. soln. of a salt of a metal mentioned in the title, by boiling the mixt. under a reflux condenser. The pptd. salt thus obtained was purified and its m. p. and soly. were detd. $\text{C}_{18}\text{H}_{32}\text{Br}_4\text{O}_2\text{Cd}$ m. 135.7-137.8°, the Co salt m. 156.5°, the Cu salt m. 142.4-145.4°, the Mg salt m. 150.1-151.7°, and the Mn salt m. 144.9-147.5°. CHCl_3 is the best solvent for the Cd and Cu salts and Et benzoate for the Mn salt. The Co and Mg salts were only slightly sol. in a few solvents. L. W. RIGGS

Hexose-cleaving enzyme system in muscle. HANS V. EULER AND KARL MYRBACK. *Svensk Kem. Tids.* 39, 102-7(1927). (In German.)—Cozymase of yeast and a similarly acting material extd. from muscle are identical substances. A. R. ROSE

Influence of magnesium salts on the coagulation of blood rendered incoagulable by citrate or phosphate. (MLLÉ.) E. SLUITER. *Arch. néerland. physiol.* 10, 461-7 (1926).—Blood or plasma rendered incoagulable by Na citrate or phosphate could be coagulated by the addn. of a 10% soln. of commercial fructose; 1 cc. of the sugar soln. coagulated 9 cc. of citrated blood in 25 min. The phenomenon did not occur with glucose, lactose, maltose or sucrose and was not due to the Ca present. The theory was first advanced that a Ca fructose complex was formed due to the presence of the ketone grouping; this later ionized giving free Ca ions. Purified fructose was inactive and analyses of the commercial product showed the presence of MgCl_2 which liberated the Ca ions from the Ca citrate, but not from the oxalate. M. H. SOULÉ

Solubility of non-radiated cholesterol in liquid ammonia. R. G. GUSTAVSON AND J. B. GOODMAN. *J. Am. Chem. Soc.* 49, 2526-8(1927).—The soly. of non-radiated

cholesterol in liquid NH_3 (mg. per 100 cc.) is reported as follows: -38° , 0; 0° , 6.16; 7° , 20.2; 14° , 27.2; 21° , 72.6; 28° , 117.2; 35° , 232.2; 42° , 301.2; 49° , 545. The soly. at -38° is beyond the sensitiveness of the Liebermann-Burchardt test. Liquid NH_3 can be used to sep. certain prepn_s of cholesterol. C. J. WEST

Catalytic decomposition of hydrogen peroxide by hemin. HANS V. EULER AND KARL JOSEPHSON. *Ann.* 456, 11J-26(1927).—With pure catalase the catalytic ability is greater than 43,000; colloidal Pt, about 40; hemin, about 5. The effect of the concn. of H_2O_2 and of hemin is shown by tables and curves. C. J. WEST

Decomposition of free and combined cystine with special reference to certain effects produced by heating fish flesh. L. H. ALMY. *J. Am. Chem. Soc.* 49, 2540-5 (1927).—When fresh fish flesh is heated in a sealed tube at 120° for 45 min., either no H_2S or only a comparatively small quantity could be detected in the heated flesh. When the flesh had become somewhat stale, the same heat treatment yielded H_2S in relatively large amts. Added cystine increased the amt. of residual H_2S only with the stale flesh. The cause of this difference in results with fresh and stale flesh was traced to the ability of the fresh flesh, and conversely, the inability of stale flesh, to destroy H_2S formed by the heating. The H_2S is apparently destroyed by oxidation. Cystine added to fresh flesh, as well as that present in combined form in the flesh, is partially destroyed by this heating. The presence of considerable H_2S in a canned product of this nature indicates that the raw material at the time of canning was in poor condition. It is probable that similar results would be obtained with other flesh products. C. J. WEST

Quantitative study of the influence of sodium acetate, sodium borate, sodium citrate and sodium phosphate upon the activity of pancreatic amylase. H. C. SHERMAN, M. L. CALDWELL AND JANE E. DALE. *J. Am. Chem. Soc.* 49, 2596-8(1927).—The activity of pancreatic amylase in the presence of 0.05 *M* NaCl and under optimal conditions of H-ion activity is practically the same in the presence of equimol. concns. of citrate and phosphate. It is slightly lower in the presence of borate and acetate but this decrease in activity seems to be more probably due to less adequate control of H-ion activity in the less adequately buffered solns rather than to any sp. effect of the acetate or borate ions. When acting in the presence of 0.05 *M* NaCl and 0.004 *M* concns. of the Na salts of boric, citric and phosphoric acids for 0.5-hr. periods at 40° , pancreatic amylase exerts its optimum activity in solns. of p_{H} 7.0 to 7.2. In 0.05 *M* NaCl the activity of the enzyme appears to be independent of the concn. of phosphate from 0.0005 to 0.05 *M* and of borate from 0.001 to 0.01 *M*, provided the optimal conditions of H-ion activity are maintained. Given optimal H-ion activity, the activity of the enzyme appears to be practically the same in starch solns. contg. 0.05 *M* NaCl and no phosphate as it is in solns. contg. phosphate as well. Thus it seems improbable that these salts have any marked sp. effect upon the enzyme. C. J. WEST

The influence of physical training on the basal respiratory exchange, pulse rate and arterial blood pressure. I. C. SCHNEIDER, R. W. CLARKE AND G. C. RING. *Am. J. Physiol.* 81, 255-63(1927).—Basal metabolism declined with training in 3 subjects and was unchanged in 2 subjects. The basal min.-vol., frequency of breathing and early morning arterial pressure did not change with the condition of training; while the standing posture pulse rate was slower in the trained subject. J. F. LYMAN

Inorganic constituents of human saliva. II. G. W. CLARK AND LENA LEVINE. *Am. J. Physiol.* 81, 264-75(1927); cf. C. A. 21, 2723.—There was no constancy in salivary Ca, P, Cl and ash under regulated dietary conditions nor during fasting. Greater variations were noted in saliva activated by chewing paraffin than in resting saliva. Ingested Cl did not increase Cl in the saliva readily; but after the abnormal ingestion of inorg. phosphates a marked excretion of P was noted in the saliva. J. F. LYMAN

The effect of the parathyroid hormone on gastric secretion. II. The calcium content of gastric juice. W. C. AUSTIN AND S. A. MATTHEWS. *Am. J. Physiol.* 81, 552-9(1927).—The gastric response of the dog to histamine was normal after the administration of the parathyroid hormone, provided the H_2O balance of the body was maintained. After overdosing the dog with parathyroid hormone the Pavlov pouch continued to secrete until the beginning of hemorrhage, when it stopped suddenly and completely. The Ca content of pure gastric juice of the normal dog is 5 to 6.5 mg. in 100 cc. Parathyroid administration in amts. sufficient to raise the blood Ca to 18 or 19 mg. in 100 cc. had no marked effect on the Ca content of the gastric juice. J. F. LYMAN

The effect of carbon arc radiation on metabolism in the dog. H. S. MAYNARD. *Am. J. Physiol.* 81, 686-91(1927).—Dorsal exposure of a short-haired pigmented dog to

C arc radiation for 2 hrs. (110.88 g. cal. per sq. cm.) a day for 8 days, followed in 17 days by a second similar series of exposures, resulted in an increased N excretion and a rise in serum Ca and P. The immediate effect of exposure to C arc radiation may be a diln. of the blood resulting from the vasodilation and diffusion of H_2O from the tissues, which temporarily depresses its Ca and P content.

J. F. LYMAN

Spectrophotometric determinations of purified bilirubin. C. SHEARD, F. C. MANN AND J. L. BOLLMAN. *Am. J. Physiol.* **81**, 774-81 (1927).—Comparative tests (1) on the soly. of purified bilirubin and of the pigment of bile and blood of normal and jaundiced animals; (2) on the transmission of light by purified bilirubin and by the pigment of bile and blood serum; (3) on the effects of fading in these substances in soln.; and (4) on the applicability of the laws of Lambert and Beer to their solns. are cited as additional evidence that bilirubin and the pigment in question are identical.

J. F. LYMAN

Distribution of pancreatic secretin in the gastrointestinal tract. M. M. WEAVER. *Am. J. Physiol.* **82**, 106-11 (1927).—In the dog secretin was found in the gastrointestinal tract only, principally in the duodenum and the small intestine immediately ensuing and to a less extent in the stomach mucosa.

J. F. LYMAN

Exhaustion due to lack of sleep. I. Introduction and methods. T. H. BAST AND A. S. LOEVENHART. *Am. J. Physiol.* **82**, 121-6 (1927). II. Symptomatology in rabbits. C. LEAKE, J. A. GRAB AND M. J. SENN. *Ibid* 127-30. III. Effect on the nerve cells of the spinal cord. T. H. BAST, F. SCHACHT AND H. VANDERKAMP. *Ibid* 131-9. IV. Effects on the nerve cells in the medulla. T. H. BAST AND W. B. BLOEMENDAL. *Ibid* 140-6.

J. F. LYMAN

Simultaneous study of the constituents of the sweat, urine and blood, also gastric acidity and other manifestations resulting from sweating. III. Urea. G. A. TALBERT, J. R. FINKLE AND S. S. KATSUKI. *Am. J. Physiol.* **82**, 153-6 (1927); cf. C. A. **21**, 2482.—In 17 subjects urea N of the sweat varied from 0.24 to 1.12 mg. per cc.; in the urine, urea N varied from 0.82 to 27.6 mg. per cc.; while urea N of the blood was between 4.6 and 34.3 mg. per cc.

J. F. LYMAN

A theory of muscle contraction with x-ray diffraction patterns from relaxed and contracted muscles. JANET H. CLARK. *Am. J. Physiol.* **82**, 181-94 (1927).—The nature and extent of crystal in muscle fibers were studied by means of x-ray diffraction patterns, taken by the monochromatic pin-hole method. In the contracted muscle there was evidence of a true microcryst. condition. The distance between the equidistant mol. planes was 9.5 A. U. in the relaxed and 8.5 A. U. in the contracted state. It is probable therefore that this distance gives the width rather than the length of the mols. forming the equidistant planes.

J. F. LYMAN

The bile acids (SCHENCK, KIRCHHOFF) **10**. The activity coefficients of protein ions (ADAIR) **2**.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

A test for bile salts in urine. G. O. BROWN. *Proc. Soc. Exptl. Biol. Med.* **23**, 596-8 (1926).—Thirty cc. of urine, 30 cc. of 95% alc., 1 cc. of a 25% soln. of CCl_3COOH , and a small quantity of charcoal are boiled together, filtered, made alk. with NaOH and evapd. to a vol. of 15 cc. An equal vol. of normal H_2SO_4 is added; a cloudiness appears in the presence of bile salts.

C. V. B.

Method for equilibrating blood with frequently changing tensions of alveolar carbon dioxide. M. G. BANUS. *Am. J. Physiol.* **76**, 216 (1926).—In electrometric detn. of blood p_{H_2} it is necessary to know the CO_2 tension of the blood so that an equiv. CO_2 tension may be used in the electrode vessel. A sample of alveolar air is obtained by means of a special cannula inserted into the trachea. The CO_2 tension in this sample is detd. by Mariotte's colorimetric method, and at the same time a mixt. of H and CO_2 , prepd. from tanks by regulating 2 needle valves, is passed through another Mariotte tube until the color matches that of the sample.

J. B. BROWN

The isolation of secretin. J. MELLANBY. *J. Physiol.* **61**, xxxvii-xxxviii (1926).—The mucous membrane of the duodenum is ground up with 4 vols. abs. EtOH and filtered. The filtrate is evapd. to opalescence, diluted with 2 vols. H_2O , and acidified. The ppt., contg. no secretin, is filtered and to the filtrate is added 0.2% bile salt or Na cholate. The pptd. bile salt, contg. the secretin, is isolated by centrifugalization and purified by dissolving in the least possible amt. of 80% EtOH, the secretin being pptd. by the addn. of an equal vol. of acetone. Secretin is probably a polypeptide.

J. B. BROWN

The biological and therapeutic action of α -rays from radium— α -radium-therapy. M. A. BIOGLIO. *Arch. Radiologia* 1, Pt. V, 3-16(1925).—The construction of an app. for the utilization of α -rays therapeutically is described. A. W. CONTIERI

Leucine as supposed evidence of poisoning in the legal chemical examination of a corpse. G. JOACHIMOGLU AND A. OKATA. *Mitt. pharm. Ges.* 1925, 6 pp.; *Chem. Zentr.* 1926, II, 82.—It was possible to characterize the suspected substance, which was recovered from the alc. ext. of the liver, as leucine by synthesis with urea to the leucinuramino acid. C. C. DAVIS

Stain solubilities. II. W. C. HOLMES. *Stain Tech.* 2, 68-70(1927); cf. C. A. 21, 2143.—Data are given to show the unreliability of statements as to the soly. of any dye unless the dye tested is known to have been free from inorg. salts. The methods employed in the present work are outlined and a table of solubilities in H_2O and $EtOH$ of 23 dyes is included. The investigation is being continued. CARL R. FELLERS

Subsidiary dyes in methylene blue. W. C. HOLMES. *Stain Tech.* 2, 71-3(1927).—Suitable tests have been devised for the detection of azure B (trimethylthionine) and methylene blue. All samples of methylene blue examd. contain appreciable proportions of azure B. In view of the facility with which methylene blue undergoes oxidation, the synthesis of a thoroughly pure product is probably impossible, even with absolutely pure intermediates; and it may also be questioned if a complete purification of the crude product is practicable. CARL R. FELLERS

The preparation of vital neutral red. MAX PHILLIPS AND BARNETT COHEN. *Stain Tech.* 2, 74-9(1927); cf. C. A. 21, 1283.—Neutral red iodide suitable for vital staining was prepd. by condensing nitrosodimethylamine-HCl with *m*-tolylethylenediamine and the indamine, tolylene blue (I), was obtained. Air oxidation converted I to eurhodine, neutral red. This was purified by conversion into the relatively insol. $SnCl_2$ double salt, filtering, dissolving in H_2O and pptg. the neutral red iodide with KI. This was redissolved in H_2O , reprecipd. with KI soln. and crystd. from 95% $EtOH$. Other preps. of neutral red iodide were made. The chloride of the color base was prepd. by continuing the air oxidation of the tolylene blue until a test sample indicated its complete conversion into neutral red. The color was salted out with NaCl and crystd. from 95% $EtOH$. Both the crystd. and uncrystd. products were found to be excellent stains. CARL R. FELLERS

Staining with phloxin. C. J. CHAMBERLAIN. *Stain Tech.* 2, 91-3(1927).—A double stain with Magdala red (I) and aniline blue has given very discordant results. This is because of the variability in compn. of I. Standardized phloxin seems to be identical with successful lots of I and staining results are uniformly good. C. R. F.

Methods for demonstrating occult blood in the feces. FRITZ HIRSCHBERG. *Deut. med. Wochschr.* 53, 971-2(1927).—A discussion of the methods employed in demonstrating the presence of occult blood. ARTHUR GROLLMAN

A study of antimony trichloride as a possible quantitative reagent for vitamin A. F. WOKES AND S. G. WILLIMOT. *Analyst* 52, 515-24(1927).—The reaction between $SbCl_3$ and vitamin A was studied quantitatively. The reaction consists of a series of color changes: blue, yellow, red, with intermediate shades. The blue is probably characteristic of active vitamin. The reaction can be retarded, and therefore studied more closely, by adding $CHCl_3$ which has been dried over $CaCl_2$ to effect dehydration. The reaction between $SbCl_3$ and vitamin A is undoubtedly a chem. reaction and is probably a condensation. In applying the test the following suggestions are made: (a) Use as reagent a satd. soln. of pure $SbCl_3$ in anhyd. $CHCl_3$. Protect from the light and moisture. Decant off 2 cc. and put in a clean, dry 0.5-in. cell. (b) Prep. a soln. of the oil with anhyd. $CHCl_3$ on the day required and adjust the concn. so that 0.1-0.3 cc. is required. Mix this with the reagent by stirring with a clean, dry rod and note the time. (c) Take a tintometer reading in Lovibond blue units, 30 seconds after mixing. (d) Keep the temp. as near 16° as possible and correct for any temp. deviation of more than 1° by the chart shown. (e) Adjust the conditions so that the reading of blue units is below 18. W. T. H.

Determination of the blood volume. II. G. SCHIECK. *Klin. Wochschr.* 6, 945-6(1927).—Blood volume was detd. by the method of Seyderhelm and Lampe; but the values obtained were lower than those recorded by S. and L. Total blood vol. is 7% of the body wt.; plasma vol. is 3.4% of the body wt. MILTON HANKE

The significance of the titration of the gastric contents with two indicators after feeding a buffer-free test meal. LUDWIG HEILMEYER AND WALTHER GRAUBNER. *Klin. Wochschr.* 6, 1035-7(1927).—The old double titration method, with dimethyl yellow and phenolphthalein as indicators, is still the most significant as a diagnostic measure. Contents from a healthy stomach contain almost no buffering substances;

hence the titration curve is steep near the neutral point and the degree of acidity will be almost identical with either indicator. Bile, blood, mucus or substances derived from a carcinoma act as buffers and gastric juice contg. these substances will show a different titration value with each of the indicators. A divergence of 15 degrees of acidity, or more, is pathological.

Glycogen studies. ERICH BURGHARD AND HANS PAFFRATH. *Klin. Wochschr.* 6, 1479(1927).—The Pflüger method for detg. glycogen is seldom applicable to man because of the speed with which glycogen is converted into glucose by autolysis. This difficulty is overcome by detg. total carbohydrate by the method of Dische and Popper.

Congo red as a protein precipitant. ERNST MISLOWITZER. *Klin. Wochschr.* 6, 1240-1(1927).—Mix 3 cc. blood with 30 cc. H₂O and 10 cc. 3% Congo red. Add a few drops of satd. AlCl₃ soln. A copious flocculation occurs which contains all of the Congo red and all of the protein. The filtrate gives no ppt. with sulfosalicylic acid.

Determination of quinine by means of the potassium iodide-mercuric iodide reagent. B. ŠVEDSKIJ. *Surnal eksper. biol. mediciny* 4, 605-13(1927); *Ber ges. Physiol. experl. Pharmakol.* 40, 849.—In pure solns. the sensitiveness of the reaction is 1:200,000. In the ether ext. of the blood deductions must be made for substances which give the same reaction. Five min. after the injection of 0.5 g. quinine-HCl 82-95.2% have disappeared from the circulation.

Determining the minimal quantities of nicotine in the blood. A. S. SOKOLOV AND K. D. LYUBOVITZEVA. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 3, 69-77.—Five cc. of blood to which definite amounts of nicotine were added was quickly transferred into a 200-250-cc. flask, which contained a boiling soln. of 25-30 cc. of H₂O and 2-3 drops of a 10% soln. of acetic acid. The flask was removed from the flame. 0.5 g. of soda and 4 g. NaCl were added and the contents steam-distd. 150 cc. were collected, evapd. in a porcelain dish on a water bath to a vol. not exceeding 25 cc. and tested with Lugol soln. for nicotine. The dilns. were carried out until no turbidity was observed. It was possible to detect nicotine in a diln. of 1:500,000.

Glycerol-potassium hydroxide solution in the microscopic investigation of blood traces. KARL MEIXNER. *Deut. Z. ges. gericht. Med.* 10, 253-5(1927).—With the aid of this soln. small traces of blood can be detected.

Total sugar of blood and urine. MARK E. EVERETT, HAROLD A. SHOEMAKER AND FAY SHEPPARD. *J. Biol. Chem.* 74, 739-59(1927).—The low values obtained in the detn. of total sugar by the Folin-Berglund hydrolysis method (*C. A.* 16, 2159) are due to the depressing effects of NaCl, formed during neutralization, and of silicates in the alkali used for neutralization on color formation. The use of 2.6 N H₂SO₄ and of silicate-free KOH as a general procedure for the detn. of total sugar by colorimetric methods is, therefore, recommended. Eight cc. of blood or urine filtrate are heated on a boiling H₂O bath for 75 min. (2½ hrs. with urine) with 1 cc. of 2.6 N H₂SO₄ in a specially designed 10-cc. volumetric flask, cooled and neutralized with 1 cc. of an equiv. silicate-free KOH soln. (kept in a paraffined bottle). The sugar content is then detd. by one of the well-known colorimetric methods (Folin-Wu, Benedict, Sumner or Folin). The data include glucose equivs. for known sugars and estns. of the destruction of sugar by acid and alkali. Higher values for total sugar than for free sugar are invariably obtained with this technic.

A micro-method for the quantitative determination of carbon dioxide in blood and other solutions, and some observations on the efficiency of paraffin oil as a means of keeping carbon dioxide in solution. DANIEL RAFFEL. *J. Biol. Chem.* 74, 839-49(1927).—The method is accurate for quantities between 0.1 and 0.5 cc. of CO₂ with an error not exceeding 1.1% and can be used with solns. of inorg. carbonates, blood serum and whole blood. The CO₂ is absorbed in Ba(OH)₂ soln. which is then titrated. Normal serum loses only 2% or less of its CO₂ in 24 hrs. when kept under paraffin oil but when large quantities are present the loss may amount to 10%.

Studies on urinary acidity and a method for electrometric titration of urine. SERGIUS MORGULIS AND W. R. HAMSA. *J. Biol. Chem.* 74, 851-61(1927).—Urine is titrated to a *p*_H of 7.4, the av. reaction of the blood, the end point being detd. by the quinhydrone electrode; one electrode is immersed in the known buffer soln. (*p*_H 7.4) and the other in the urine; the connection is made by an agar-KCl bridge and the urine is titrated until the potential difference, indicated by a galvanometer, disappears. The titration proceeds rapidly and is exceedingly sensitive, even a fraction of a drop being definitely registered by an oscillation of the galvanometer. The magnitude of the variation between the electrometric method and Folin's method of titration (to

a p_H of about 8.5) is a function of the p_H of the urine and the degree of discrepancy increases with the falling H-ion concn. of the urine. The cause of this increasing discrepancy may very well be the markedly high buffer value of urine above p_H 7.4; urines do not titrate like a mixt. of the pure substances concerned and must possess considerable buffer action which is independent of its phosphate, NH_3 , or org. acid content. At present no explanation of these high buffer values is offered but the suggestion is made that the buffer action may be assocd. with the colloidal properties of urine. Urine acidity detns., even when made by a reliable elec. method, have a limited significance and should, therefore, be regarded less as strictly quant. than as indications of the general trend of the metabolism of the organism. A. P. L.

Studies on methods. VII. LUDWIG PINCUSSEN. *Biochem. Z.* **186**, 28-35 (1927).—Description of a quinhydrone micro-electrode, a pipet for micro-analysis of blood gases, and a micro-titration app. S. MORGULIS

Studies on methods. VIII. LUDWIG PINCUSSEN. **The determination of the total sulfur in urine and in organs.** ARTHUR KONARSKY. *Biochem. Z.* **187**, 398-402 (1927).—A measured quantity of urine (usually 5-10 cc., but much smaller amts. in cases of cystinuria) is mixed with 1 g. $NaNO_3$ and 5 cc. of Benedict's oxidation reagent (200 g. $Cu(NO_3)_2$ and 50 g. $KClO_3$ in 1000 cc. H_2O) in a previously weighed centrifuge tube (made of resistant porcelain). This is evapd. carefully (the addn. of 1 cc. concd. HNO_3 is advisable but not essential) and gradually heated to red glowing, whereby the oxidation of org. matter is completed. After cooling 10 cc. HCl (1:4) is added and warmed until soln. is complete. To this is now added 5 cc. of warm 10% $BaCl_2$, and the ppt. is centrifuged after 2 hrs. The ppt. is then washed with H_2O and centrifuged until the supernatant liquid is Cl -free. The traces of water are evapd. and the tube is heated to redness. The tube is weighed and the gain in wt. $\times 0.1373$ gives the amt. of S in the $BaSO_4$ ppt. For the detn. of the total S of organs or various org. materials, this is first dried and powdered, a measured amt. of the powder being used for the analysis. The procedure is the same as for urine except that the preliminary evapn. is carried out with 1-2 cc. HNO_3 , and 10 cc. of Benedict's reagent is taken instead of 5 cc. S. MORGULIS

The differential calorimeter and the determination of the human basal metabolism. A. K. NOYONS. *Bull. assoc. hyg. aliment* **15**, 315-43 (1927).—After a review of the development of the differential principle in calorimetry, descriptions are given of the 3 models of differential calorimeters devised by N. for use with small (C. A. 19, 1875-6), medium-sized and large animals, with an explanation of the method of using them and a discussion showing that the results agree with those obtained by other methods. Bibliography of 37 references (since 1920). This is a summary of a more important work by N., published in English by René Fonteyn, Louvain, Belgium.

A. PAPINEAU-COUTURE

The determination of small quantities of bismuth in tissue, excreta, blood and bone. J. A. SULTZBERGER. *J. Am. Pharm. Assocn.* **16**, 218-21 (1927).—Digestion is accomplished by dry ashing over the Bunsen burner in Pyrex beakers or porcelain dishes. None of the Bi is lost at the temp. of the Bunsen burner, while the C is oxidized rapidly. No pptn. is necessary except in the analyses of bone, where the amt. of salts is too great for soln. in a small quantity of soln. The Bi is detd. colorimetrically in HCl soln. with an excess of KI . The liberation of free I by oxidation in the presence of Fe is prevented by the addn. of $NaHSO_3$. Chlorides do not interfere. L. E. WARREN

The osmometric method of determining the molecular weights of proteins. GILBERT ADAIR. *J. Am. Chem. Soc.* **49**, 2524-5 (1927).—Discussion of the recent work of Svedberg (C. A. 20, 1256, 21, 746), citing work of A. (C. A. 19, 2676, 3050) on the osmometric data for hemoglobin. C. J. WEST

A new instrument for measuring the cadaver heart gas. F. DYRENFURTH. *Deut. Z. ges. ger. Med.* **9**, 459-63 (1927).—The app. is described and sample detns. are given. FRANCES KRASNOW

The reagents for medicinal examinations in the German Pharmacopeia, 6th ed., and their practical applications. G. HEYL. *Apoth. Ztg.* 1927, Nos. 2 and 5; *Schweiz. Apoth. Ztg.* 65, 97-104, 109-11 (1927).—This article is a concise treatise on the examn. of urine, stomach contents and blood. In each case the reagents are given, and the mode of using these in carrying out the tests.

S. WALDBOTT

The technic and interpretation of the van den Bergh test; its value in detecting latent jaundice. R. E. STEEN. *Irish J. Med. Sci.*, 6th series, No. 21, 573-82 (1927).—A modified technic is described. The diazo reagent is composed of 2 solns.: Soln. A contains sulfanilic acid 1 g., concd. HCl 15 cc. and distd. H₂O 1000 cc. Soln. B contains NaNO₂ 0.5 g. and distd. H₂O 100 cc. The diazo reagent consists of 5 cc. of A and 0.15 cc. of B mixed thoroughly and prepd. fresh each time. *Technic of the "direct" test.*—To 0.5 cc. serum an equal quantity of diazo reagent is added. If a red color develops within 1 min. there is "hepatic bilirubin" in the serum; if the color of the serum remains unchanged, either "hepatic bilirubin" is absent, the normal amt. of "non-hepatic bilirubin" being present, or an abnormally great quantity of this bilirubin is present and will be shown by a color change in the "indirect" test. *Technic of the "indirect" test.*—To 1 cc. of the original serum, 2 cc. of 96% alc. are added and the mixt. is shaken and centrifuged. To 1 cc. of the supernatant fluid is added 0.25 cc. of the diazo reagent. A violet color is formed quickly, but takes some time to deepen, in milder reactions. Both types of bilirubin give an "indirect" reaction; only "hepatic bilirubin" gives the "direct" reaction. The "direct" reaction is positive when a pink or red color develops in the serum within 1 min. If such color develops within 2 min. and the "indirect" test is not strongly positive, one may suspect an old serum or a minute quantity of "hepatic bilirubin." In the "direct" test a subsequent deepening of the color occurs whether non-hepatic bilirubin is present or not. Accordingly, the van den Bergh reaction cannot be used to distinguish between catarrhal and toxic jaundice. Sera to be tested should not be exposed to direct sunlight for any length of time. The "direct" test is of great practical value in detecting latent obstructive jaundice, i. e., cases where a very tiny quantity of bilirubin has been absorbed from the ducts, and is insufficient to color the skin or mucous membranes, or produce biliuria.

R. C. WILLSON

Estimation of CO₂ and of carbonates in solution. Application to the determination of CO₂ in body fluids (NICLOUX) 7.

Shadow-producing composition for use in medical radiography. B. RAPP. U. S. 1,644,446, Oct. 4. BaSO₄ 100 is used with sucrose 12.5 parts and gum tragacanth. A special method of prep. the mixt. is described.

C--BACTERIOLOGY

A. K. BALLS

Further studies on staphylococcus bacteriophage. BESSIE R. CALLOW. *J. Infectious Diseases* 41, 124-36 (1927).—C. passed a staphylococcus suspension in distd. H₂O through a Berkefeld filter and obtained a bacteriophage free from broth constituents and which did not give any protein color tests. The addn. of several salts in a concn. greater than 0.01 M proved injurious to the bacteriophage, the activity of which decreased as the valence of the anion or cation of the salt increased. Heat at 60° for 1/2 hr. destroyed the bacteriophage. Kaolin and alumina cream adsorbed the bacteriophage.

PAUL R. CANNON

Pyruvic acid and methylglyoxal as intermediate products of lactic acid fermentation. S. KOSRYCHEV AND S. SOLDATENKOV. *Z. physiol. Chem.* 168, 124-7 (1927).—A culture medium consisting of whey, peptone, NaCl and CaCO₃ was inoculated with *Bact. caucasicum*. During the first 3 days NH₂NHCONH₂·HCl was added in small portions. At the end of 14 days the mixt. was boiled and filtered, treated with (CO₂H)₂ to remove Ca evapd. *in vacuo*, and extd. with Et₂O to remove lactic acid. A cryst. ppt. was finally obtained which was sepd. into 2 fractions by crystn. These were identified as the semicarbazone of AcCO₂H and the disemicarbazone of AcCHO.

A. W. DOX

Alcohol fermentation. XII. Methylglyoxal as an intermediate product of alcoholic

yeast fermentation. S. KOSTYCHEV AND S. SOLDATENKOV. *Z. physiol. Chem.* **168**, 128-31 (1927); cf. C. A. **21**, 3206.—Cf. preceding abstr. By fermenting sucrose in the presence of $\text{NH}_2\text{NHCONH}_2 \cdot \text{HCl}$, then boiling, filtering and evapg. the product, crystals of AcCHO -disemicarbazone were obtained and identified. The semicarbazone of AcCO_2H was not obtained in this expt., although it was probably present. These are the first satisfactory demonstrations of the formation of AcCHO in biol. processes. A. W. DOX

Variability of the Gram reaction. H. J. CONN, *et al.* *Stain Tech.* **2**, 80-7 (1927).—Slides were prepd. bearing smears of 6 different organisms known to differ widely in their behavior to the Gram reaction. A single technician prepd. 120 such slides and distributed them to 10 collaborators with identical directions. In 4 of 6 cultures all 10 collaborators gave consistent reports. The other 2 cultures proved so variable in their reaction toward the staining method that it is impossible to consider them either Gram-positive or Gram-negative. Such organisms must be regarded as belonging to an intermediate group, and should be called *Gram-variable*. This work strengthens the theory that there is a definite relationship between the Gram reaction and the isoelectric point of the bacteria. CARL R. FELLERS

Examination of halophilic microorganisms. WM. CLAYTON AND W. E. GIBBS. *Analyst* **52**, 395-7 (1927).—"Pink" on salt cod fish and "salt stains" on hides may be produced as a result of curing with solar salt. It must be admitted that there are microorganisms which can only exist and develop in the presence of considerable amts. of NaCl and these so-called halophilic stains have not been studied much. The prepn. of chromogenic and non-chromogenic stains of this nature is described in detail. W. T. H.

Physicochemical study of specific constituents of bacteria. I. Differentiation between Bruce's micrococcus and B. Bang. EGIDIO VALENTI. *Biochim. terap. sper.* **14**, 77-115 (1927).—Expts. with 55 strains of *B. Bang* (*B. abortu* Bang) (I) and 44 strains of *B. melitense* (Bruce) (II) gave the following results: Heating (100°) either alone or in the presence of 0.1 *N* HCl does not permit a differentiation; I is always resistant, II only in a certain percentage of cases. Delipoidation by heat offers a reliable method of differentiation. The suspension of a 48 hr. agar culture in 12-14 cc. 0.1 *N* NaCl is heated 30-60 min. at 100° , then shaken out with an equal vol. of ether. After this treatment (I) always gave a distinct pptn. with all concns. of sp. serum, II gave either no agglutination or only with the stronger serum dilus. This loss of sp. agglutination suggests a profound change in the chem. nature of the component responsible for the reaction. The differentiation can be made with I serum only, since II serum agglutinates almost all I strains. MARY JACOBSEN

Thermophilic species of *Penicillium arenarium* nov. sp. producing citric acid. V. SHAPOSHNIKOV AND A. YA. MANTEIFEL. *Trans. Sci. Chem.-Pharm. Inst.* **1923**, No. 5, 3-27.—Morphologic and physiologic characters of a new species of *Penicillium* producing citric acid at a temp. of 40° are given. The compn. of the medium and the influence of various substances on the growth of the fungus are described. J. S. JOFFE

Physiology of *Penicillium arenarium* in connection with citric fermentation. V. SHAPOSHNIKOV AND A. YA. MANTEIFEL. *Trans. Sci. Chem.-Pharm. Inst.* **1923**, No. 5, 28-56.—A more extensive study of the organism (cf. preceding abstract). J. S. J.

The biological significance of the citric acid fermentation. V. SHAPOSHNIKOV. *Trans. Sci. Chem.-Pharm. Inst.* **1923**, No. 5, 57-64.—A theoretical discussion. J. S. J.

The bactericidal action of the commoner phenols and of some of their derivatives on *Bacillus pestis*. J. F. CAIUS, B. P. B. NAIDU AND SHAMSHER JANG. *Indian J. Med. Research* **15**, 117-34 (1927).—The substances studied fell within four main groups: (1) the phenols; (2) derivs. of phenols; (3) the phthaleins and (4) derivs. of fluorescein. A comparatively high activity was manifested by hydroquinone (1:432,000), mercurochrome-220-sol. (1:76,800), pyrocatechol (1:48,000), α -nitroso- β -naphthol (1:25,600), toluhydroquinone (1:14,400), 2,4-diaminophenol (1:10,000), carvacrol (1:11,200), and 2,4,6-trichlorophenol. The phthalein dyes show relatively small bactericidal value. FRANCES KRASNOW

A note on nutrient broth now used for the culture of *Bacillus pestis* and its hydrogen-ion concentration. B. P. B. NAIDU AND SHAMSHER JANG. *Indian J. Med. Research* **15**, 135-9 (1927).—The p_{H} of the broth of 100 samples was between 6.6 and 7.4 and in 85 cases between 6.6 and 7.0. The most favorable immunity is obtained by using the vaccine from broth, the initial p_{H} of which was 6.8. 175 rats were used. FRANCES KRASNOW

A comparative studying of staining methods for demonstration of spirochetes.

K. YASUYAMA. *J. Philippine Islands Med. Assoc.* 7, 215-7(1927).—Fontana's method is superior to any other method for staining spirochetes and is the most practical one, because it is simple and quick. It gives excellent results in 15 min. F. K.

The separation of lipid fractions from tubercle bacilli. R. J. ANDERSON. *J. Biol. Chem.* 74, 525-35(1927).—The lipids were extd. from moist, living tubercle bacilli at room temp. with a mixt. of alc. and Et₂O followed by extn. with CHCl₃. To prevent oxidation, air was rigidly excluded by using an atm. of CO₂. Three fractions were thus obtained consisting of glycerides, phosphatides, and wax, the wax constituting more than 1/2 of the total lipoids. Over 2000 cultures were used, each culture contg. on an av. a little less than 2 g. of dry bacteria and the total lipid material representing 23.78% of the dry bacilli. The following amts. of lipid fractions and other compds. were obtained: 1st phosphatide 148.5 g., 2nd phosphatide 104.6 g., Me₂CO-sol. fat 240 g., CHCl₃-sol. wax 427 g., base pptd. by HgCl₂ 7.2 g., base pptd. by phosphotungstic acid 5.3 g., polysaccharide 33.9 g., dried bacterial residue 2902 g., total 3868.5 g. The polysaccharide in the pure state is quite insol. in alc. and Et₂O and was present in the ext. probably by reason of the H₂O contributed by the fresh bacteria to the alc.-Et₂O mixt.; it could be pptd. from aq. soln. by alk. basic Pb acetate. **A study of the phosphatide fraction of tubercle bacilli.** *Ibid* 537-51. —After elimination of 58.6 g. of wax from the 2nd phosphatide fraction (cf. above) by several repts. and the purification of the 1st phosphatide, the compn. of the 2 fractions was found to be practically identical, the combined fractions amounting to 194.5 g. or somewhat more than 5% of the dry bacilli. The purified first fraction was hydrolyzed and a study made of its cleavage products. As a result of this study and the actual isolation of the different cleavage products its compn. may be calcd. to be as follows, per 100 parts of the phosphatide: palmitic acid 30.5, oleic acid after reduction to stearic 12.8, liquid satd. fatty acid 20.9, glucose 13.9, sugar acid 13.8, glycerophosphoric acid 5.4 parts. The total value is low because of inevitable losses in the sepn. of the compds. especially the fatty acids. The nature of the satd. liquid fatty acid and the sugar acid is still unknown. The carbohydrate complex is combined in such a manner in the phosphatide mol. that reduction of Fehling's soln. occurs only after hydrolysis. Practically all the N in the phosphatide can be distd. off in the form of NH₃ in the presence of dil. alkali and as only about 0.3% of N is present, it appears probable that NH₃ is the only N-contg. base present and that it is probably bound on the phosphoric acid. Air was excluded in all operations as completely as possible by using an atm. of CO₂. A. P. LOTHROP

The nitrogen content of aspergillin. AUGUST RIPPEL AND KURT WALTER. *Biochem. Z.* 186, 474-7(1927).—Aspergillin is the amorphous black coloring matter in the spores of *A. niger*. The alc.-sol. fraction of this substance contains 3.3%, the alk.-sol. fraction approx. 4.3% N, which is uninfluenced by the N content of the nutrient medium. S. MORGULIS

The enzymic metabolism of bacteria. IV. The use of biological glucose determination. P. RONA, D. NACHMANSOHN AND H. W. NICOLAI. *Biochem. Z.* 187, 328-43(1927).—The fact that *B. coli* does not split sucrose or maltose under anaerobic conditions while it decomposes their split products with the formation of acid is utilized as a basis for the gasometric detn. of hexose. With Warburg's app., the CO₂ set free from the NaHCO₃ by the acid thus produced serves as a measure of the hexose production. This is further applied to the study of sucrase and maltase activity as well as of amylase. S. MORGULIS

Studies on the cultivation of Bacillus influenzae (Bacillus of Pfeiffer) on synthetic media. GOTTFRIED PETRAN. *Centr. Bakt. Parasitenk. I Abt.* 103, 29-38(1927).—When the reaction is adjusted with Na₂CO₃, *B. influenzae* needs (along with X and V substances) Na, PO₄ and, as a source of N, NH₃. Asparagine is not well utilized. If the medium is protein-free, degeneration forms occur. This is prevented by a trace of peptone, *l*-tyrosine, or *l*-cystine. *l*-Leucine is slightly utilized, and tryptophan and *d*-alanine not at all. JOHN T. MYERS

The fat metabolism of skin fungi. I. The fat-splitting powers of living fungus cultures. ASTA V. MALLINKRODT-HAUPT. *Centr. Bakt. Parasitenk. I Abt.* 103, 73-87(1927).—In general, *Hyphomycetes* seem to utilize low m. p. fats best. Tributyrin is not as good as triolein, but better than tristearin or tripalmitin. Vegetable oils permitted very little growth. JOHN T. MYERS

The differential diagnostic value and technic of the catalase reaction. M. KNORR. *Centr. Bakt. Parasitenk. I Abt.* 103, 147-51(1927).—The catalase reaction is of value in identifying organisms. JOHN T. MYERS

The theory of the Gram stain. GEO. KALINA. *Centr. Bakt. Parasitenk. I Abt.*

103, 172-6(1927).—In Gram-positive organisms the I reacts only with the ectoplasm, while in Gram-negative organisms it reacts with the deeper cell substance and the resulting granules resist the action of a solvent. JOHN T. MYERS

The value of cystine in growing the diphtheria bacillus. H. BRAUN AND F. R. MUNDELL. *Centr. Bakt. Parasitenk. I Abt.* 103, 182-4(1927).—The addn. of 0.0125% of cystine to Loeffler's medium hastens the growth of the diphtheria bacillus. JOHN T. MYERS

The influence of sodium chloride on the formation of involution forms of spore-forming bacteria. P. P. SMIRNOFF. *Centr. Bakt. Parasitenk. II Abt.* 70, 29-36(1927).—A concn. of 2.5% NaCl in media caused *B. alvei* to grow as shorter wider cells. A greater concentration prevented cell division, producing filaments with a normal diameter. A concn. of NaOH between N/150 and N/300 produced small involution forms. The same concn. of HCl produced large involution forms. J. T. M.

Fat- and wax-splitting fungi. HEINRICH ZIKES. *Centr. Bakt. Parasitenk. II Abt.* 69, 161-3(1926).—Pure fats and waxes do not support the growth of fungi. Positive results in the past were probably due to adherent traces of proteins and carbohydrates. JOHN T. MYERS

The influence of variations in atmospheric conditions on the growth and fermenting powers of yeast. H. ZIKES AND F. WAGNER. *Centr. Bakt. Parasitenk. II Abt.* 70, 193-202(1927).—The speed of fermentation by yeasts is related to the atmospheric conditions in the container, such as the presence of ordinary air, N, air washed with H_2SO_4 , or the use of a valve to permit escape and prevent entrance of gases. The total amt. of fermentation did not depend on these factors but on the inherent fermenting powers of each species. JOHN T. MYERS

The iron bacteria of the Gallionella group. KARL SUESSENGUTH. *Centr. Bakt. Parasitenk. II Abt.* 69, 327-39(1927). JOHN T. MYERS

The synthetic action of bacterial lipases. N. VAN DER VALLE. *Centr. Bakt. Parasitenk. II Abt.* 70, 369-73(1927).—*B. pyocyaneus* produces a lipase capable of combining fatty acids with propyl, isobutyl, amyl, hexyl and octyl alcs; methyl- and nonyl-carbinol; and glycerol. The reaction is slow with methyl, ethyl and benzyl alcs. and *nil* with ethylene glycol. It was very slow with AcH and methyl, ethyl and amyl alcs., and glycerol and *nil* with butyric acid and glycerol. The staphylococcus yields an enzyme capable of causing fatty acids to combine with glycerol but not with amyl alc. *B. prodigiosus* will cause fatty acids and glycerol to combine. *B. coli* and *B. dysenteriae* produced no synthetic lipase. JOHN T. MYERS

The influence of high salt concentration on bacteria from the Liman estuary at Odessa. M. A. BARANIK-PIKOWSKY. *Centr. Bakt. Parasitenk. II Abt.* 70, 373-83(1927).—At the highest salt concn. of the Liman water, 25° to 26° Baumé, some bacteria can grow and split protein with the formation of NH_3 and H_2S ; at greater concns., growth was slowed. Three species were isolated which would grow in water satd. with sea salt. The max concn. for NaCl is less, H_2S production stops at 20% and NH_3 at 25%. The size and form of the cells differ with varying salt concns. JOHN T. MYERS

A type of urea-splitting bacterium found in the human intestinal tract. J. V. COOKE AND HAZEL REED KEITH. *J. Bact.* 13, 315-9(1927).—The characteristics are described of a microorganism commonly found in the intestinal tract of infants and older children, and having exceptional power of splitting NH_3 from urea. The name *Bact. ammoniagenes* is suggested. JOHN T. MYERS

Studies on the aerobic bacteria commonly concerned in the decomposition of cellulose. L. A. BRADLEY AND L. F. RETTGER. *J. Bact.* 13, 321-45(1927).—Cellulose-decompg. organisms are closely associated with decaying vegetable matter. The fermentation reactions of the group suggest a means of strain differentiation. The presence of a buffer increases the amt. of cellulose decompn. The presence of cellulase may be demonstrated by the auxanographic method on cellulose casein-digest agar. A long bibliography is appended. JOHN T. MYERS

Interfacial surface tension and bacterial growth. NEAL DAVIS. *J. Bact.* 13, 381-6(1927).—If bacteria are looked upon as analogous to oil drops, both the stimulating and the toxic effects of cations can be explained. JOHN T. MYERS

The relation of surface tension to bacterial development. O. R. PIZARRO. *J. Bact.* 13, 387-408(1927).—Inhibition of bacterial growth was due to the chem. nature of the depressant rather than to decreased surface tension. JOHN T. MYERS

The diffusion products of bacterial cells as influenced by the presence of various electrolytes. H. J. SHAUGHNESSY AND C. E. A. WINSLOW. *J. Bact.* 14, 69-99(1927).—In addn. to direct absorption of H or OH ions, bacterial cells exert a distinct influence

upon the reaction of the menstruum. This involves the liberation of acids in alk. media and of alk. substances in acid media. With *B. coli* the ultimate p_{H} approximates 6.2-6.4. This is apparently an adaptive reaction. On prolonged exposure to a somewhat unfavorable medium, *B. cereus* will liberate so much NH_3 that the medium becomes alk. and the cells die. The cells of both *B. coli* and *B. cereus* are relatively impermeable to Cl, Ca and PO_4 ions, but allow the free passage of CO_2 and NH_3 and these produce the effects on the menstruum. In general the wall of *B. cereus* is more permeable than that of *B. coli*. Dil. solns. of NaCl (0.145 M) tend to increase cell wall permeability. A strong soln. of NaCl (1.450 M) and CaCl_2 of moderate strength (0.0145 and 0.1450) decrease permeability to alkali and increase it for acid. The strong Ca soln. shows with *B. coli* a sharp initial rise in titratable alk. and acidity followed by a fall probably due to decrease in permeability leading to lysis with liberation of protein followed by an accumulation of non-reactive films on the particles, or absorption of oppositely charged ions.

JOHN T. MYERS

The influence of carbon dioxide on bacteria. GEORGE VALLEY and LEO F. RETTGER. *J. Bact.* 14, 101-37(1927); cf. *C. A.* 20, 2870.—Removal of CO_2 from an environment otherwise favorable to development stops bacterial growth completely. The addn. of 0.03% of CO_2 often stimulates growth. CO_2 is necessary to the growth and development of the bacterial cell. There is a long bibliography.

J. T. M.

Color diffusion in Endo agar. ELIZABETH F. GENUING and LUCY E. THOMPSON. *J. Bact.* 14, 139-56(1927).—The reaction should never be more acid than p_{H} 7.4. Na_2SO_3 is much more satisfactory than NaHSO_3 . Exposure to light is negligible. Fuchsin should be tested for its ability to be decolorized by Na_2SO_3 .

JOHN T. MYERS

Studies of selective bactericidal action. E. A. COOPER and JOHN MASON. *J. Hyg.* 26, 118-6(1927).—Germicides can be divided into 2 classes, chem., those which react with protoplasmic constituents; and physico-chem., those which ppt. cell proteins. *B. fluorescens non-liquifaciens* and related organisms are selectively attacked by physico-chem. germicides as phenol, while *B. coli* is less sensitive to them but more to chem. germicides as the quinones. Hot water, alcs. and phenols all react in a similar manner, *B. coli* being less sensitive than *B. fluorescens*. Substitution of various groups into the benzene ring in the case of the aromatic disinfectants affects the germicidal power on *B. coli* and *B. fluor. non-liq* unequally, with the result that the selective action may be obscured or even reversed. Selective action is not affected by temp., period of disinfection, nature of the culture medium, no. of bacteria present, or the phys. state of the disinfectant.

JOHN T. MYERS

The use of hypochlorites as a sterilizing agent for dairy utensils. W. A. HOY and JANET R. L. RENNIE. *J. Hyg.* 26, 127-31(1927).—There is danger that Cl will be added to the milk or the vessels to be recontaminated by the much washing necessary to remove it.

JOHN T. MYERS

A new method of preparing staphylococcal hemolysin. J. W. BIGGER. *J. Path. Bact.* 30, 271-6(1927).—Staphylococcal hemolysin may be prepd. by suspending staphylococci from a solid medium in isotonic NaCl soln and freeing the fluid from cocci by centrifuging, leaving the purest lysin yet obtained. It is thermostable, the titer being reduced only one half by 100° for 30 min. It can be dried by evaporation and retains its activity for months. It is insol. in alc., ether, CHCl_3 , or acetone. It acts best in a slightly alk. medium. No definite antibody has been produced.

J. T. M.

The influence of cultural conditions on the production of diphtheria toxin. A. F. WATSON and ELSIE LANGSTAFF. *J. Path. Bact.* 30, 383-413(1927).—Growth-promoting "substances" are to be distinguished from toxin-inducing "substances." Both are preserved if sterilization is carried out by filtration through a Seitz press followed by a short steaming.

JOHN T. MYERS

The titration of bacteriophage and the particulate hypothesis. H. CLARK. *J. Gen. Physiol.* 11, 71-81(1927).—The theory of the serial diln. method for the titration of bacteriophage has been worked out on the assumption that the presence of one or more particles of bacteriophage in any tube always results in the dissolution of the bacteria, and that the particles are not dissociated, coalesced, adsorbed or otherwise lost during the process of diln. When the diln. const. is 0.1 it is shown that only about 60% of parallel runs on the same soln. should give the same end-point. In actual experience an est. of 85% has been obtained. No explanation of the discrepancy is offered.

C. H. R.

Physiologic significance of ethylenic linkages of fatty acids. EMILÉ F. TERROINE, R. BONNET, G. KOPP and J. VÉCHOT. *Bull. soc. chim. biol.* 9, 605-19(1927).—Cultures of *S. nigra* and of *B. de la Fléole* showed a relation between high temp. and the production of satd. acids and low temp. and unsatd. acids production. The rate of growth

of *S. nigra* is slow on the fatty acids of butter (I index 33) and rapid on the fatty acids of linseed oil (I index 180). The formation of satd. fatty acids at the expense of glucose by *S. nigra* and *B. de la Fléole* requires a greater expenditure of energy than does the formation of unsatd. acids. The formation of satd. fatty acids is not only the proof but the consequence of a greater activity of the vital processes. L. W. R.

Mechanism of action of aliphatic acids, particularly the non-saturated acids and their soaps, on bacteria and toxins. P. SEDALLIAN AND L. VELLUZ. *Bull. soc. chim. biol.* 9, 824-36(1927); cf. C. A. 21, 3677.—The object of this study was to learn the mechanism of inactivation of toxins by the soaps (cryptotoxins). Expts. were made with tetanus toxin neutralized by appropriate quantities of soaps of the satd. acids (lauric, palmitic, stearic) and the unsatd. acids (crotonic, dimethylacrylic, undecylenic, oleic, linolenic and ricinoleic). Surface tension changes do not suffice to explain the neutralizing power of the soaps. The adsorption of the soap by the micellae of the toxin appears necessary but not sufficient. The inactivation is accentuated by the presence in the soap mol. of ethylenic linkages and an alc. hydroxyl. The insolv. of the acids corresponding to the soaps, and their spreading force, appear to be concerned in the mechanism of inactivation. These same factors are believed to influence the formation of cryptotoxins and the inhibition of diastases. L. W. R.

Autoelimination of ammonia in cultures of microorganisms. A. BERTHELOT AND (Mlle.) G. AMOUREUX. *Bull. soc. chim. biol.* 9, 932-4(1927).—The object of this study was to learn the quant. relation which exists in cultures during the autopptn. of ammonia. Cultures of *Proteus vulgaris* were made in sterilized peptonated water 1.5%. Some of the cultures were modified by the addn. of 1.3% $MgSO_4$, 0.566 Na_2HPO_4 and 0.433 KH_2PO_4 . At the beginning the p_H of the cultures was 6.8. After 15 days at 37° the p_H of the controls was 8.0, while that of the modified cultures was 6.0. These cultures were allowed to remain in the thermostat for 4 months, then at lab. temp. 4 months when the crystals of NH_4MgPO_4 were filtered out and weighed and the NH_3 and amino acids in the filtrate were detd. The NH_3 pptd. in the control culture was 0.007 g. per l., that in the modified culture was 0.795 g. Thus the autopptn. of NH_3 prevents the culture from becoming too alk. for the growth of the organism. L. W. RIGGS

Physico-chemical antagonism of bacteria. C. ARNAUDI, W. KOPACZEWSKI AND M. ROSNOWSKI. *Compt. rend.* 185, 153-6(1927).—The conditions of surface tension, p_H , and elec. cond. of media in which certain bacteria show antagonism were studied. General conclusions did not appear to be warranted by the results. L. W. RIGGS

Filtrable elements of tuberculous virus. (Mlle.) A. TOGUONNOFF. *Compt. rend. soc. biol.* 97, 349-51(1927).—Cultures of Koch bacilli whether virulent or not may contain filtrable elements which pass the Chamberland filters. These filtrable elements cause, in exceptional cases only, the sp. nodular lesions in the guinea pig in which they are inoculated. L. W. RIGGS

Influence of acetone on the development and chemical composition of bacteria. ALBERT BERTHELOT, (Mme.) St. DANYSZ-MICHEL, (Mlle.) E. OSSART AND G. AMOUREUX. *Compt. rend. soc. biol.* 97, 437-8(1927).—Ten species of the more common pathogenic bacteria were developed in cultures contg. from 2 to 5 vol. % acetone. Of these *B. subtilis*, *B. coli* and staphylococci were subjected to 8 passages in 4 days in acetone bouillon at the optimum for each, after which they could be cultivated in acetone bouillon contg., resp., 2, 3/2 and 1/66 times as much acetone as at first. Cultivation of *B. subtilis* in water-peptone-acetone increases its sugar content. L. W. RIGGS

Germicidal power of ethyl alcohol in spirits. B. B. BRAHMACHARI. *Indian Med. Gaz.* 62, 384-5(1927).—In distilleries spirits are dild. with water which is freely open to contamination. Tests proved that *V. cholerae* cannot live for more than 4 hrs. in 11.8% alc. or more than 1 day in 7.8% alc. *Bacillus typhosus* is more resistant but does not survive 11.48% alc. for more than 1 day. Dysentery bacilli disappear from 15.75% alc. in 4 hrs. L. W. RIGGS

The production of certain enzymes by *Bacterium pruni*. S. I. JODIDI. *J. Agr. Research* 35, 219-21(1927).—Proteolytic and lipolytic enzymes have been shown to be present among the products of growth of *Bacterium pruni* in milk. W. H. ROSS

Sulfur metabolism of yeast. H. SUGATA AND F. C. KOCH. *Plant Physiology* 1, 337-47(1926).—Various forms and amts. of S were added to an artificial culture medium contg. known, but very small quantities of S, and the rate of growth of yeast was detd. Mg and sulfate were found to be equally important in yeast growth. The inorg. sulfate form proved the most available. Sulfate-S is converted into yeast protein and probably at least in part into cystine. Cystine, cysteine and H_2S stimulate yeast

growth in a sulfate-free medium up to certain, but low concns. Above these concns. they retard growth. Yeast growing in a sulfate-free medium contg. cystine as the source of S converts part of the cystine into new yeast protoplasm and about an equal amt. into sulfate left in the medium. The effects of taurocholic acid, cysteinic acid and taurine are also reported.

WALTER THOMAS

The use of certain carbohydrates and glucosides in the differentiation of members of the Salmonella group of food-poisoning bacilli. FRANK WOKES AND J. H. IRWIN. *Pharm. J.* **118**, 747-51; *Chemist & Druggist* **107**, 37-9 (1927).—Of the Salmonella group of food-poisoning bacilli, 21 members have been examd. both in regard to their action on the animal, and by chem. reactions, with a view to evolving new biochem. methods of identification. Immune sera were prepd. of specially high titer, and by means of these, serological classification was worked out. Using this as a basis, the bacterial enzyme action of the organisms was examd. on a series of 24 alcs., carbohydrates and glucosides. Of these, the most useful results were obtained with arabinose, xylose, sorbitol, mannitol, dulcitol, mannose, sucrose and maltose. Of the glucosides, arbutin showed the greatest differentiation. Esculin and salicin gave the same results, and amygdalin and phlorluzin were not acted upon.

S. WALDBOTT

Soluble specific substance of Friedländer's bacillus. III. Isolation and properties of the specific carbohydrates from Types A and C of Friedländer bacillus. W. F. GOEBEL AND O. T. AVERY. *J. Exptl. Med.* **46**, 601-7 (1927); cf. *C. A.* **20**, 614; **21**, 3646.—Cultures of Type A Friedländer bacillus, digested with a sterile soln. of purified trypsin, pptd. with AcONa and EtOH and the ppt. of impure carbohydrate purified by pptn. from aq. soln. with 2 vols. EtOH (5-6 times), the soln. (500 cc.), treated with 50 cc. 1.1 HCl, dialyzed, concd. to 200 cc., treated with 400 cc. AcOH, the filtered soln. concd. and poured into 10 vols. Me₂CO contg. a little HCl, gives a practically N-free, amorphous powder, with α_D from -100° to -105° , acid equiv. 430-445, contains no ash, 43.98% C and 6.00% H and gives 64-68% reducing sugars on hydrolysis (as glucose). Acid hydrolysis gives a reducing soln. which shows a strong naphthoresorcinol test (glucuronic acid or an isomer). The similar product from Type C bacillus has α_D 100° , an acid equiv. of 680, gives about 75% of reducing sugar (the larger part of which is glucose, isolated as the osazone); it also contains glucuronic acid. In both instances sp. function and carbohydrate are apparently inseparable.

C. J. WEST

Effect of serum upon the germicidal action of soaps. A. H. EGGERTH. *J. Exptl. Med.* **46**, 671-88 (1927).—By detg. the germicidal titers over a wide range of p_H a characteristic curve for each test substance is obtained. The curve for a particular concn. of serum bears a definite relationship to the curve for salt soln. (buffer) alone. Wherever the titer in salt soln. is high, very small quantities of serum greatly diminish that titer. If the titer in salt soln. is low, small quantities of serum leave the titer unchanged. Thus small addns. of serum flatten the curves and make them more nearly horizontal. If further large amts. of serum are added, a further reduction in titer takes place at all reactions. The Ca of serum has only a very slight effect upon the soap titer; the protein is probably inhibitory to soaps but the curve for partially defatted serum and those for other protein substances tested do not run parallel to the serum soap curves. The various lipoids that are known to be present in serum are inhibitory to the action of soaps, both as emulsions and as clear solns. The action of serum upon soaps may be regarded as a complex reaction, in which lipoids, protein, and, to a lesser extent, Ca salts take part. Their effect is due to the fact that these substances, by combining with the soaps, remove them from the field of germicidal action.

C. J. WEST

Researches on the formation of diastase by *Aspergillus niger*. G. L. FUNKE. *Rec. trav. botan. neerland.* **23**, 200-44 (1926); *Ber. ges. Physiol. exptl. Pharmacol.* **39**, 736.—The growth of *Aspergillus niger* and the formation of amylase are inhibited by the brown substances formed from reducing sugars on sterilization in the presence of alkali (glass). In fructose solns. alone these substances increase the amylase production. The amylase production is the same in KH₂PO₄ and K₂HPO₄ solns. It is not influenced by glycerol, promoted by glucose and starch and inhibited by fructose, mannose, lactose, inulin and the metabolites formed in the presence of mannose or galactose although not by galactose itself. There seems to be a certain relation between the structure of the diastase and that of the sugars which *A. niger* can assimilate.

MARY JACOBSEN

Fermentation of substituted carbohydrates by bacteria of the colon-lactis aerogenes group. HERMAN HEES AND CASPER TROPP. *Centr. Bakt. Parasitenk. I Abt.* **100**, 273-84 (1926).—The fermentation of many methylated sugars, alcs. and glucosides was studied. The eosin-methylene blue medium of Levine is the best means for sepn. of

B. coli and *B. aerogenes*. Two S-contg. carbohydrates, benzylthiogluco-side, and glucose-ethylmercaptan, were fermented by *lactis aerogenes* only. JOHN T. MYERS

Infertilizing power of some vegetable essences against human tubercle bacilli in vitro. P. COURMONT, A. MOREL AND I. BAY. *Compt. rend. soc. biol.* **96**, 1313-4.—Of phenol, guaiacol, thymol, oil of savory, lavender, citron, orange, bergamot and spike, thymol has the strongest infertilizing power. Of the essences that of thymol is most active. Guaiacol, which is sometimes used in the treatment of tuberculosis, is among the least active. L. W. RIGGS

Weakening action of the colloidal state on the infertilizing power of essences with reference to microorganisms. A. MOREL, A. ROCHAIX AND A. CHEVALLIER. *Compt. rend. soc. biol.* **97**, 495-6 (1927).—Tests with thymol, carvacrol and essence of *Eucalyptus citriodora* and of *E. globulus* showed a diminution of the infertilizing power of these essences on passing from the mol. to colloid state. L. W. RIGGS

Study on *B. coli* in water and milk by means of esculin media. A. RICHAIK. *Lait* **4**, 541-4 (1924); *Abstracts Bact.* **9**, 325.—Esculin, a glucoside derived from Indian chestnuts, is broken down by some organisms into glucose and esculetine, a complex diphenol which gives a brown color with ferric citrate. An agar medium contg. peptone, bile salts, esculin and ferric citrate was used with 51 strains of *B. coli*. The characteristic dark halo failed to appear in 37.25% of the cases. Moreover, many other bacteria give the characteristic reaction. Conclusion: Esculin fermentation does not give a reliable reaction for detecting *B. coli* in water or milk. H. G.

The fate of *B. coli* and *B. aerogenes* in sewage purification (HEUKELEKIAN) **14**.

B. M. DUGGAR

Investigations of the effect of the potash supply on the chlorophyll content, assimilation, growth and yield of potatoes. TH. REMY AND H. LIESEGANG. *Landw. Jahrb. Schweiz.* **64**, 213-40; *Chem. Zentr.* **1926**, II, 2104-5.—Three problems were investigated: (1) the influence of the K supply on the chlorophyll content of the leaves; (2) the existence of some relation between the chlorophyll content of the leaves and the assimilation process; and (3) the reason why plants with an adequate supply of K_2O but with low chlorophyll content show better assimilation than plants deficient in K_2O . (1) Field expts. with kainite, KCl and K_2SO_4 showed that the chlorophyll content of potato leaves is greatly diminished by K_2O , confirming the observation of Maiwald. (2) The starch test of J. Sachs showed that plants adequately supplied with K_2O always contained more starch than the spotless leaves of plants deficient in K_2O . There is then no relation between chlorophyll content and assimilation. (3) The smaller chlorophyll content in leaves of plants satd. with K_2O is more than compensated by the larger size of the leaves. The leaves of healthy plants have a longer span of life than those of plants deficient in K_2O . An adequate K_2O supply is the basis of a strong assimilation process. Expts. with sugar beets were unsuccessful because the method of detn. of chlorophyll according to Willstätter failed to give results. C. C. DAVIS

The relation of maturity of California plums to shipping and dessert quality. F. W. ALLEN, J. R. MAGNESS AND M. H. HALLER. *Calif. Agr. Expt. Sta., Bull.* **428**, 1-41 (1927).—Changes which were studied as the fruit of different varieties matured on the tree as well as after picking and storage included (1) increase in size, (2) change in color, (3) firmness of flesh, (4) sol. solids and sugar content, and (5) acidity. Increase in size continues at the rate of 1.5-2% daily until the fruit becomes fully colored. Measured by a *mech. pressure tester*, the firmness of the flesh gives an accurate index of the maturity and shipping quality of plums. Sol. solids increase from the time the first color appears to full maturity. The amt. of increase is insufficient for hydrometer readings to serve as an index to picking maturity. Sugar content increases as long as the fruit remains on the tree. Plums contain from 1 to 3% acid when picked, the acidity decreasing with later pickings. In early picked fruit, the expressed juice and the fruit as a whole are approx. equal in acidity. In later pickings there is much less acid in the expressed juice. After picking most varieties soften twice as rapidly at 52° F. as at 43° F. The rate of softening is controlled largely by temp. Sol. solids remain const. after picking though the sugar content increases somewhat in the larger, meaty types, though in other varieties no increase is shown. The acidity of the expressed juice decreases gradually after picking. Prompt pre-cooling and refrigeration are recommended for plums to be marketed at a distance from the orchard. C. R. F.

Cauliflower production in California. H. A. JONES AND F. H. ERNST. *Calif. Agr.*

Expt. Sta., *Circ.* 11, 1-36(1927).—The growth, fertilizer treatment, blanching, harvesting, grading, standardization and shipping of cauliflower are presented.

CARL R. FELLERS

Pollination and life history studies of lettuce (*Lactuca sativa* L.). H. A. JONES. *Hilgardia* 2, 425-79(1927).—An embryological and cytological study.

C. R. F.

Freezing as a method of preserving plant tissue for the determination of nitrogenous fractions. G. T. NIGHTINGALE, W. R. ROBBINS AND L. G. SCHERMERHORN. N. J. Agr. Expt. Sta., *Bull.* 448, 1-16(1927).—Methods are described for the aq. extn. of nitrogenous constituents from green plant material. These fractions include protein, sol. proteose, basic, amide, amino, NH_3 , humin and nitrate N. Beet leaves, tomato and sweet potato stems, and sweet potato storage roots were the materials used. Two freezing tests were used, *i. e.*, 48 hrs. and 7 days at temps. between -5° and -14° . Macro-chem. data are presented which show that minced plant tissue may be preserved by freezing with no modification of nitrogenous fractions which interfere with the methods here employed for N dissection. Amino acids or nitrogenous materials of humin N filtrates do not interfere with the recovery of NO_3 -nitrogen by the Ulsch method. The necessity of supplementary microchem. observations in studies involving N metabolism is emphasized. A list of 28 references is given.

C. R. F.

Determination of hardness in apple varieties and the relation of some factors to cold resistance. AUBREY C. HILDRETH. Minn. Agr. Expt. Sta., *Tech. Bull.* 42(1926).—Neither moisture content, sugars, pentosans nor amino N offered a reliable basis for sepg. hardy and tender varieties. There was some indication that high reserves of carbohydrates and of org. N might be correlated with greater hardness. Degree of cold injury is directly proportional to the duration of exposure to a given low temp. A rapid fall in temp. above the killing point is more injurious than gradual lowering. The importance of desiccation as a factor in winter killing is questioned. Terminal growths of apple varieties of known hardness have been exposed to artificially produced low temps. Classifying these varieties on the basis of the resultant injury, the order agrees closely with that of their hardness as shown by field experience. The rise of this test in detg. hardness of seedlings and varieties of unknown cold resistance seems practical.

CARL R. FELLERS

Anthocyanins appearing in the pigment of Isabella grapes. R. J. ANDERSON AND F. P. NABENHAUER. N. Y. Agr. Expt. Sta., *Tech. Bull.* 123, 1-13(1926).—The pigment in Isabella grapes is a monoglucoside, $\text{C}_{23}\text{H}_{35}\text{O}_{12}\text{Cl} + 4\text{H}_2\text{O}$, prisms. It appears to be identical with the anthocyanin, enin, which appears in the blue European grape. Anthocyanidin chloride, $\text{C}_{17}\text{H}_{15}\text{O}_7\text{Cl} + 1.5\text{H}_2\text{O}$, prepd. by hydrolyzing the glucoside, crystallizes in prisms, and is apparently identical with enidin. When the Ac deriv. of the anthocyanidin was oxidized with neutral KMnO_4 , syringic acid was formed and by sapon. of the latter, acetylsyringic acid was obtained. The compn. of enidin chloride is represented as 3,5,7-trihydroxy-2-(4-hydroxy-3,5-dimethoxyphenyl)benzopyrylium chloride.

CARL R. FELLERS

Microchemical researches. B. HEINZE. *Landw. Jahrb. Schweiz.* 64, 65-169; *Chem. Zentr.* 1926, II, 1569-70.—A discussion of the importance of the nitro bacteria and vitamins for the cultivated plants.

A. L. HENNE

Recent advances in science: agricultural physiology. JOHN HAMMOND. *Science Progress* 22, 218-24(1927).—A review of recent biochem. work on various aspects of growth.

JOSEPH S. HEPBURN

The tannin cells in the fruit pulp of different varieties of Diospyros (date plum, persimmon, etc.). C. GRIEBEL. *Z. Untersuch. Lebensm.* 53, 525-34(1927).—The fruit pulp of *D. lotos* L., *D. virginiana* L. and *D. kaki* L. fil. consists chiefly of mesocarp cells and of cells which contain a compd. which on hydrolysis with KOH yields gallic acid, phloroglucinol and pyrocatechol.

WILLIAM J. HUSA

Some changes occurring during the ripening of grapes. III. P. R. V. D. R. COFFMAN. Dept. Agr. Union S. Africa, *Science Bull.* 60, 19 pp.(1927); cf. *C. A.* 21, 2012.—The results of this work confirmed those obtained in previous investigations. Data on 6 varieties of grapes indicated that definite equil. between acid, sugar and solids was established at maturity.

K. D. JACOB

The value of the chemical test in the identification of wild white clover. WM. M. FINDLAY AND GEORGE DOWER. *Scottish J. Agr.* 10, 219-24(1927).—The test is based on the production of HCN, as indicated by the change in color from yellow to reddish brown of test papers dipped in a soln. of Na_2CO_3 and picric acid, when crushed seedlings of wild white clover are incubated at 32° for several hrs. From a study of this test it was concluded that if the large and small seeds of a sample of English wild white clover both give strong positive reactions it indicates that the sample is true wild

white clover. If the large seeds of a sample give a weaker reaction than the small seeds it indicates that the sample is either cultivated wild white clover contg. a proportion of ordinary white clover, or a mixt. of ordinary and wild white clover. Samples of English seed that gave a strong positive reaction gave good yields when sown in the field while those that gave negative reaction were failures. Many samples of American white clover reacted positively to the test. K. D. JACOB

Seasonal variations in the carbohydrate content of swedes. JOHN CALDWELL. *Scottish J. Agr.* 10, 325-32(1927).—The total carbohydrate content of swedes of the Scotia variety was highest in roots harvested about the first of December, the dry matter and carbohydrate content diminishing rapidly in roots left in the ground after that time. On the other hand, the highest percentages of dry matter and carbohydrates were found in roots harvested during the latter part of September, increases in wt. after that time being largely due to absorption of H_2O . K. D. JACOB

Nitrate utilization by plants. I. The regime of nitrate nitrogen under natural conditions of plant development. A. SHMUK. *Ann. Kuban Agr. Inst.* (Russian) 3, 77-94(1926).—Summarizing the results of a series of expts. S. concludes that soils entirely covered with vegetation contain either no free nitrates, or very minute amounts. Disappearance of nitrates cannot be explained exclusively by the direct utilization of nitrates, by leaching out or by inhibition of nitrification processes. It is a result of the specific action of the root-mass, which stimulates the activities of denitrifying organisms as well as the denitrifying enzymes of the plants. The reduction of nitrates by plant roots in soln. goes on with great energy and the products formed are nitrites and ammonia; it is thus logical to look to ammonia as a N source for plants. J. S. JOFFE

The cashew nut. H. LUDOWYK. *Trop. Agr. (Ceylon)* 69, 43-6(1927).—A short review of the chemistry of the nuts of *Anacardium occidentale* is given. A. L. M.

Distribution of potassium and sodium in terrestrial plants. G. ANDRÉ and E. DEMOUSSY. *Bull. soc. chim. biol.* 9, 861-6(1927). See C. A. 20, 3069. L. W. R.

Production of nitrites by *Verticillium* in pure culture. J. DUFRÉNOY. *Bull. soc. chim. biol.* 9, 934-5(1927).—Cultures of the fungus *Verticillium*, isolated from various common trees and plants, showed the presence of nitrites after 15 days at 25°.

L. W. RIGGS

Nature of the sugars and of their metabolism in the iris. H. COLIN and A. AUGEM. *Compt. rend.* 185, 475 8(1927).—*Iris germanica*, the closely allied species *I. pallida* and *I. florentina* and innumerable derived varieties have a rhizome contg. starch. *Iris pseudacorus* on the contrary stores in reserve a levulosan, irisin, without a trace of starch; its seeds have a horny albumin rich in mannoses and 0.1% of starch. *Iris foetidissima* is intermediate between *I. pseudacorus* and *I. pallida* in that its rhizome and seeds contain both levulosan and starch. The leaves of the 3 species contain starch only in the stomata. It is remarkable that a thousand attempts to cross these species have failed. L. W. RIGGS

Determination of the osmotic value of the yeast cell by changing the weight of the cell. G. SELIBER and (MLLE.) R. KATZNELSON. *Compt. rend. soc. biol.* 97, 347-9(1927); cf. following abstr.—Yeast cells immersed in solns. of NaCl of different concns. gain or lose water according to the concn. of the soln. When the cell has lost a certain quantity of water it becomes plasmolyzed, and the concn. under which plasmolysis occurs is called the *osmotic value*. The no. of billions of cells per g. in 2% soln. of NaCl was 7.41 by filtration and 6.43 by centrifugation; in 4% soln. of NaCl the figures were 11.2 and 9.65, resp. It is probable that by prolonged centrifugation the figures would more nearly approach those obtained by filtration. L. W. RIGGS

Influence of the composition of the medium on the osmotic value of the yeast cell. G. SELIBER and (MLLE.) R. KATZNELSON. *Compt. rend. soc. biol.* 97, 449-50(1927); cf. preceding abstr.—The addn. of NaCl to the medium causes an increase in the osmotic value of the cell. The addn. of sucrose or glucose to the medium causes an increase in the osmotic value proportional to the amt. of sugar added. The increase for glucose is less in proportion to its mol. concn. than for sucrose. L. W. RIGGS

Influence of mercuric chloride on the osmotic value of the yeast cell. G. SELIBER and (MLLE.) KATZNELSON. *Compt. rend. soc. biol.* 97, 515-6(1927); cf. preceding abstr.—Yeasts acclimated to $HgCl_2$ show an increase in the concn. of cell juice and of dry matter. L. W. RIGGS

Selection for quality of oil in soy beans. L. J. COLK, E. W. LINDSTROM and C. M. WOODWORTH. *J. Agr. Research* 35, 75-95(1927).—Continuous selection both for high and low quality of oil within one variety of soy bean for 7 years produced a high and a low line differing to a significant extent in their av. I number. An av. of the last

3 years' data showed an I value of 133.7 for the high line and 124.9 for the low line. The high line selected entirely on the basis of chem. analyses proved to be a late tall type with purple flowers whereas the low line was early dwarf and white-flowered. The evidence indicates that late maturity provides the more favorable conditions for the complete development of the unsatd. acids that are responsible for high quality of oil. Selection for high or low quality of oil proved to have no appreciable effect on the quantity or percentage of oil produced by the plant which makes it possible to select for high quality without decreasing the percentage of oil. W. H. R.

Metabolism of nitrogen compounds in dormant and non-dormant potato tubers. WILLIAM NEWTON. *J. Agr. Research* 35, 141-6(1927).—The absorption of nitrates by potato tuber tissue abbreviated the dormant period but under the same conditions NH_4 salts did not affect it. There was a tendency for the amino and amide N to be greater in non-dormant than in dormant tubers but growth was not directly dependent upon the actual concn. of either of these compds. Proteolytic enzyme activity was more intense in the expressed juice of non-dormant than in that of dormant tubers. When casein was added to the juice the rate of the accumulation of amino acid was a straight-line function of the time of incubation. Evidence was obtained which indicated that when potato juice is incubated amino acid N is converted into amide N. The addition of asparagine to dormant tuber juice activated the carbohydrate hydrolytic enzymes but had no apparent influence upon non-dormant tuber juice. W. H. ROSS

Plant physiology at the Ithaca Congress. FRANK THONE. *Plant Physiology* 1, 293-305(1926).—A synopsis of the papers related to the physiology of plants given before the International Congress of Plant Sciences at Ithaca, N. Y., August 16-23 (1926). WALTER THOMAS

Temperature effects in the metabolism of wheat. W. E. TOTTINGHAM (WITH THE ASSISTANCE OF E. J. RANKIN, A. D. DICKSON AND H. W. LOUWSME). *Plant Physiology* 1, 307-36(1926).—Details (with figure) are given of improvements in app. (cf. C. A. 17, 3523) for the control of environmental factors in plant growth, together with methods of estg. the total illumination effective from the sun and artificial sources. Each one of 9 series of wheat cultures in water, sand and soil were subjected to 2 planes of temp., but to uniform illumination and atm. humidity. Atm. humidity has little influence upon the protein content of wheat during the period of seed development. Considering only fully nourished plants, under the lower plane of illumination (530 and 1150 foot candles over a 12-hr. day), the production of dry matter (especially straw) was favored by the lower temps. and the percentage of protein was increased, but at the expense of the available carbohydrates. With adequate illumination (1560 and 2510 foot candles over a 12-hr. day), plants harvested at $\frac{1}{3}$ and $\frac{1}{4}$ their full growth periods contained greater percentages of sucrose and protein at lower temps. This storage is probably detd. by the plane of sugars, the latter then detg. the plane of protein synthesis. Mature plants contained increased percentages of carbohydrates and gave much greater yields, especially of grain, at the lower temps. As an explanation of these results, Tottingham advances the idea of a crit. balance between the temp. responses of photosynthesis and respiratory decompn. WALTER THOMAS

Studies on the oxidation of certain fatty acids. J. B. RHINE. *Plant Physiology* 1, 349-61(1926).—Hydrolysis of the mixed fatty acids from linseed oil by enzymes from germinating fatty seeds gave negative results. Hydrolysis at higher temps. (60-95°), increased acidity, and with an abundant supply of O, indicated that fatty acids undergo a mild oxidation, in which they absorb O, become hydroxylated and break up into shorter-chain acids and aldehydes and probably into other fragments. This breakdown differs in its products from all other methods of oxidizing fatty acids. The products remaining in soln. in water approach more nearly the sugars in structure than those reported in any previous method of oxidation. The products consist of (1) unidentified water-sol., ether-insol. non-volatile aldehydes, having more O than that of the aldehyde or carbonyl group; (2) unidentified volatile aldehydes, sol. in water and in ether; (3) short-chain volatile acids sol. in water, ether and alc., fermentable by bread yeast, giving CO_2 . WALTER THOMAS

The chemical analysis of plant tissues. C. O. APPLEMAN, W. E. LOOMIS, T. G. PHILLIPS, W. E. TOTTINGHAM AND J. J. WILLAMAN. *Plant Physiology* 1, 397-402 (1926).—Recommendations of the Comm. on Methods of Analysis of Plant Material for the American Society of Plant Physiologists. The first report consists of a crit. discussion with suggestions of methods of (1) sampling, (2) extn., (3) desiccation, (4) removal of lipoids, (5) detn. of moisture and (6) expressing results. W. T.

The use of potassium oxalate as a deleading reagent. W. E. LOOMIS. *Plant*

Physiology 1, 403-7(1926).—The advantages and disadvantages of the various leading reagents recommended for clarifying exts., preparatory to the detn. of sugars, are discussed (cf. *C. A.* 10, 2993; 17, 2091). L. modifies his previous recommendation (cf. *C. A.* 21, 3652) by giving 0.2-0.5g. as the proper excess of $K_2C_2O_4$ to be added.

WALTER THOMAS

Aqueous extracts of seeds as agents in the preparation of silver sols. R. V. MILLER AND R. P. HIBBARD. *Plant Physiology* 1, 409-13(1926).—Stable negatively charged Ag sols, having elaborate colors, were prepd. by the addn. of 2 drops of 0.1 *N* $AgNO_3$ to the filtered aq. exts. of pea, bean, tomato, corn, wheat, buckwheat, grass, sunflower, lettuce, beet, rice, soy bean and cotton seeds. The speed of the reaction is increased by exposure to sunlight, but over-exposure will ppt. the Ag. The reducing substances have not been identified, but results thus far lead to the belief that they consist of alc. and water-sol. proteins, with sugar as the stabilizer. The active materials appear to be most abundant in the seed coats.

WALTER THOMAS

Climatic effects in the metabolism of maize. W. E. TOTTINGHAM AND H. W. KERR. *Plant Physiology* 1, 415-6(1926); cf. *C. A.* 20, 2872.—The analyses were made on the composite samples of leaf, stalk and ear tissue taken from 50 plants 6 times in a period of 10 days during mid-August. The percentage of sucrose in the dry matter of the leaf greatly exceeded that of reducing sugars. Both sucrose and dextrins varied in general with solar radiation. Sugars in the stalk and ear varied independently of their proportions in the leaf, and the same was true of mono-amino acids. The compn. of the stalk was relatively stable and correlated with that of the ear. Comparison of the compn. in leaves of Yellow Dent maize with that of Marquis wheat and Black Amber sorghum grown in adjacent fields with similar cultural treatment and sampled simultaneously suggests that the stability of maize and sorghum against climatic influences may be due to their higher content of sucrose and less sol. forms of protein, and lower content of such reactive compds. as glucose, sol. proteins and other sol. nitrogenous compds. More data, however, are needed to det. this definitely.

WALTER THOMAS

A device for maintaining constant level of culture solutions. F. G. ANDERSEN. *Plant Physiology* 1, 417-8(1926).—Description with figure of the app. successfully used at the Univ. of Calif. for growing woody plants in continuously flowing culture soln.

WALTER THOMAS

Substances accompanying cellulose. KURT HESS. I. **Plant cell membranes. The carbohydrates of the ivory nut.** MAX LUDTKE. *Ann.* 456, 201-24(1927).—The dry ivory nut meal, after extn. with 0.25-0.3% ClO_2 soln., contains 7.8% cellulose. After extn. of mannan A (I) with 5% and then with 10% NaOH, mannan B (II) is sepd. as the Cu alkali compd., which is decompd. with 5% AcOH and pptd. with MeOH; the yield is about 18 g. per 100 g. extd. meal; II is a white, somewhat hygroscopic powder, which gives a violet color with $ZnCl_2$ but is not colored by $KI.I.H_2SO_4$; α^{18}_D 0.513°. II yields a *tri-Ac deriv.*, α^{17}_D -25.2° ($CHCl_3$); hydrolysis gives mannose. Pure I gives no reaction with $ZnCl_2$ or $KI.I.H_2SO_4$, α^{20}_D -44.94° (*N* NaOH); the *tri-Ac deriv.* has α^{21}_D -29.41° (*N* NaOH). Hydrolysis gives mannose. The behavior of I and II in NH_4OH -Cu(OH)₂ solns. is discussed. The max. yield of reducing substance (90-3%) is obtained by 12 hrs. hydrolysis with 75% H_2SO_4 . No trace of glucose was found.

C. J. WEST

Relation between respiration and water content in higher fungi, with a note on the effect of light on respiration. F. J. RICHARDS. *New Phytologist* 26, 187-201(1927).—With a given species of fungus the rate of respiration of the Sporophore bears a definite relation to the H_2O content. Agarics generally respire faster than Polypores. Desiccated xerophilous fungi when moistened again recover respiration only so long as spore discharge recovers also. No evidence was found that the rate of respiration of fungus Sporophores differs in any constant manner in darkness from the rate under diffuse daylight or elec. lamps.

H. R. KRAYBILL

The utilization of atmospheric nitrogen by green plants. GEORGES TRUFFAUT AND N. BEZSSONOFF. *Rev. gen. sci.* 37, 389-94(1927).—Corn plants were grown in cultures inoculated with various N-fixing bacteria and in sterile cultures. Very marked increase in growth was obtained in the cultures with N-fixing bacteria. The results show that many plants can obtain their necessary N at the expense of the air from that fixed by bacteria nourished on the excretions of the plant.

H. R. KRAYBILL

The influence of soil reaction on the growth of plants. EBERHART HOLZAPFEL. *Landw. Jahrb.* 65, 745-77(1927).—The effect of increasing p_H is shown in plant growth, food value and absorption of Ca and H_3PO_4 . The alky. of the plant ash increases with

p_H with the exception of clover. The ratio mol. $\text{CaO/mol. P}_2\text{O}_5$ according to Wrangell is found not to be a true measure of the absorption of H_3PO_4 by the plant. Neutralization of the acidity by $\text{Mg}(\text{OH})_2$ has the same effect as $\text{Ca}(\text{OH})_2$, if there is sufficient Ca for food.

GEORGE R. GREENBANK

Influence of radium rays upon hereditary variations in the *Datura stramonium*. C. S. GAGER WITH A. F. BLAKESLEE. *Ann. Rept. Brooklyn Botanic Garden* 16, No. 2, 25; No. 3, 165 (1927).—Preliminary study of the influence of Ra treatment upon the hereditary units in flowers of *Datura stramonium* indicated (1) a higher % of chromosomal mutations; (2) a new compd. chromosomal type; and (3) new factor mutations. These expts. are being continued.

N. M. NAYLOR

Influence of the absolute reaction of the soil on the formation and the composition of the essential oil of Marjolaine (DEEL, DEEL) 17. Stomatal numbers, their value for distinguishing species (TIMMERMAN) 17. Preharvest factors which affect wheat quality (MENGELS) 12. Genetic relation of terpenes (ASCHAN) 10.

E—NUTRITION

PHILIP B. HAWK

A color reaction associated with vitamin D. M. J. SHEAR. *Proc. Soc. Exptl. Biol. Med.* 23, 546-9 (1926).—Three cc. of a soln. of 1 part concd. HCl and 5 parts aniline were added to an equal vol. of oil in a wide test tube. The contents were mixed and boiled for $\frac{1}{2}$ min. Upon standing the mixt. sepd. into 2 layers, the lower layer was colored an intense red when oils supposedly contg. vitamin D were used. C. V. B.

Studies on inorganic salt metabolism. II. The effect of the sudden alteration of the acid-base balance of the diet on dogs. M. R. JONES. *Proc. Soc. Exptl. Biol. Med.* 23, 578-81 (1926); cf. *C. A.* 21, 1467.—Convulsions and in some cases death followed the sudden alteration of the acid-base balance of the diet in dogs. The nature of the phenomena is not explained.

C. V. B.

The production of antirachitic properties in human milk resulting from irradiation of the mother. A. F. HESS, M. WEINSTOCK AND E. SHERMAN. *Proc. Soc. Exptl. Biol. Med.* 23, 636-8 (1926).—The exposure of a woman to the rays of a Hg vapor quartz lamp every other day for the period of 1 month produced antirachitic properties in her milk. Rachitic rats, given 25 cc. of this milk daily, rapidly recovered as shown by the radiograph and by the increase of inorg. P in the blood from 1.98 mg. % to 5.61 mg. %. The milk had no curative properties during the control period.

C. V. B.

Changes in the excretion of uric acid produced by experimental hepatic insufficiency. J. L. BOLLMAN AND F. C. MANN. *Proc. Soc. Exptl. Biol. Med.* 23, 685-7 (1926).—After an 18-hr. fast, the ingestion of 175 g. of fresh pancreas is followed by the excretion of 120 mg. of uric acid in 24 hrs. in the normal dog. Dogs with an Eck fistula excrete from 120 to 750 mg. in the 24 hrs. after feeding; the amt. is roughly proportionate to the extent of liver atrophy.

C. V. B.

Epinephrine reaction in obesity. C. I. KRANTZ AND J. H. MEANS. *Proc. Soc. Exptl. Biol. Med.* 23, 698-9 (1926); cf. *C. A.* 21, 3393.—The rise in metabolism and in ventilation after epinephrine injection in obese subjects showed no significant difference from that in normal controls. The basal respiratory quotient was lower in the obese and along with the pulse pressure showed less increase following epinephrine.

C. V. B.

Avitaminosis and inoculation "in vivo." C. SETTI. *Biochim. terap. sper.* 14, 137-45 (1927).—Pigeons in avitaminosis show less resistance to virulent bacteria inoculation.

A. W. CONTIERI

The action determined by the type of feed in normal feed and in autoclaved feed. G. GUERRINI. *Biochim. terap. sper.* 14, 153-70 (1927).—Doves which show a preference for a certain one of the foods, rice, peas and lentile, prefer the same feed even when autoclaved. In all cases, however, the autoclaved feed is less sufficient than the normal.

A. W. CONTIERI

Defects in nutrition and their importance with respect to the blood sugar and glycogen of the organs. II. Studies of carbohydrate exchange. GEORG EISNER. *Z. ges. exptl. Med.* 52, 214-47; *Chem. Zentr.* 1926, II, 2611; cf. *C. A.* 21, 947.—Normally nourished rabbits tolerated the feeding of excess dextrose for long periods without injury. During hunger, the blood sugar curve increased with increasing loss of wt. and its inax. was postponed. Large quantities of glycogen appeared in the liver, but this content returned to normal after 24 hrs. Feeding of excess grape sugar also resulted in loss of wt., glucosuria and disappearance of glycogen. Disappearance of glycogen occurred in all animals fed merely excess sugar. The absence of glycogen in the liver

probably lasts only a few hrs. after feeding of dextrose. During hunger the capacity for forming and fixing glycogen was retained, whereas animals fed only sugar, and therefore deficient in vitamins, lost their capacity for fixing glycogen. C. C. DAVIS

Vitamin R. F. HERRING. *Z. med. Chem.* 4, 56-7; *Chem. Zentr.* 1926, II, 1906.—**Vitamin R** (where R is the first letter of the producer's name) is an ext. from a specially grown type of yeast. From the indigestible yeast cells are extd. chem. health factors (nucleoproteins, tryptophan, lipoid-P, 2% lecithin and enzymes) and converted to a form which renders them directly assimilable by the organisms. It is recommended that they be added to denatured milk. C. C. DAVIS

Pharmacognostic themes. III. Secretions and excretions. L. E. GOESTER. *Pharm. Weekblad* 64, 1001-16(1927).—A discussion of the origin and function of volatile oils, balsams, resins and gums in the plant economy. A. W. DOX

The white potato as a source of vitamin B. J. F. LYMAN AND INEZ BLYSTONE. *J. Home Econ.* 18, 199-204(1926).—The white potato used as the sole source of vitamin B in the diet supplies enough for practically max. growth in white rats when it constitutes 80% of the ration. When it constitutes 40% or less there is rapid nutrition failure which is relieved by the addn. of yeast mixts. With only 5% potato present typical polyneuritis appears almost as soon as when vitamin B is absent from the ration. L. D. ELLIOTT

Maternal diet and lactation. P. MABEL NELSON. *J. Home Econ.* 18, 383(1926).—Expts. on lactating rat mothers and their litters afford evidence that the toxic symptoms observed in litters whose mothers are consuming certain high protein diets are due not to the protein per se but to accompanying deficiency in vitamin B. L. D. E.

Vitamin E and iron assimilation. NINA SIMMONDS. *J. Home Econ.* 19, 585-7(1927).—In a series of expts. designed to discover the limiting factor in milk when this is the sole source of nutrients milk powder and carbohydrates supplemented with small amts. of a number of normal foods were fed. When 95% of the milk-carbohydrate-agar mixt. was supplemented with 5% of a cereal grain, wheat germ, yeast, purified proteins of various kinds, cooked beefsteak, or cooked beef liver, only the liver proved highly effective in making good the deficiencies of milk, as little as 2% of cooked dried beef liver being very effective. Liver being rich in both vitamin E and in iron it is suggested that its value in anemia may be due to this fact. L. D. ELLIOTT

Utilization of rye from the nutritive standpoint. ERICH GEORGE. *Ber. Verhandl. sächs. Akad. Wiss. Leipzig, Math.-phys. Klasse* 78, 381-98(1926).—Two normal students were placed on a carefully regulated rye bread, sugar and fat diet, for periods of 6 days each. Increasing strengths of rye flour were used each period. Comparative analysis of the bread ingested and the resulting feces and urine showed a progressive percentage loss in N, calorific value, ash, org. solid matter, etc. Both persons lost weight with a fusion of body tissues as indicated by a negative N balance. R. C. E.

Does the net energy value of food depend upon the purpose for which it is used in the body? H. H. MITCHELL. *Science* 66, 289-92(1927).—Exptl. evidence indicates that no net energy value can be assigned for a given food function. Animal detn. of relative net energy food values are being obtained on assumptions and in contradiction to established exptl. findings. RUSSELL C. EBB

The influence of a change in diet on the peripheral blood vessels. I. Meat diet and vegetable diet. M. GANSSLEN. *Klin. Wochschr.* 6, 786-91(1927).—An exclusive meat diet leads to an enlargement of the peripheral capillaries with kinks and aneurysal sacks. The results are similar to those obtained after administration of histamine. An exclusive vegetable diet leads to an elongation and a reduction of the diameter of the capillaries. MILTON HANKE

Ergosterol balance. H. BEUMER. *Klin. Wochschr.* 6, 941-2(1927).—Ergosterol (provitamin A) was fed to a premature baby in 0.1-g. portions on four successive days. The stools were analyzed for ergosterol. Only 147 mg. was recovered. The excretion had stopped three days after the last administration. The compd. was either destroyed by bacterial action in the intestine, catabolized in the body or stored. Expts. were not performed to ascertain how the sterol was lost. MILTON HANKE

Rickets prophylaxis. VALERIE BRUCK-BIESOK, C. PIRQUET AND RICHARD WAGNER. *Klin. Wochschr.* 6, 952(1927).—The authors recommend producing an antirachitic milk by irradiating the cow rather than by irradiating the milk. MILTON HANKE

Is the antirachitic vitamin of cod-liver oil an irradiated ergosterol? A. ADAM. *Klin. Wochschr.* 6, 1289(1927).—The author cites evidence that indicates that the above question can be answered in the affirmative. The ultra-violet absorption spectrum of insulin is very similar to that of ergosterol. MILTON HANKE

Antisterility vitamin, fat-soluble E. H. MCL. EVANS, G. O. BURR AND T. L. ALTHAUSEN. *Memoir Univ. California* 8, 1-176(1927).—Chapters are devoted to general characteristics of the sterility disease produced in rats by pure foods or other dietaries lacking fat-sol. vitamin E; the histopathology of gestation in animals deprived of this vitamin; male sterility with dietaries lacking it; the widespread occurrence of initial fertility in animals reared on simplified diets; distribution of the vitamin in foods of animal origin, and of plant origin; proof of the existence of this vitamin in the tissues of animals reared upon natural foods and of its depletion in the tissues of animals reared upon synthetic rations; the survival of fertility in animals shifted from a diet contg. vitamin E, to one deprived of it; the presence of this vitamin in the tissues of normal new born young; proof of the use of this vitamin in the ordinary metabolic processes of the body; the failure of an excess of vitamin E (2 to 20 times the normal requirement) to increase fertility beyond normal limits; the successful parenteral administration of vitamin E as a cure of sterility in female rats; the efficacy of a single curative dose of this vitamin administered at the beginning of gestation; detn. of the min. effective dose of this vitamin in the cure of sterility in the female rat (daily doses of 15 to 30 mg. of wheat germ oil or a single dose of 300 to 600 mg. given intraperitoneally lie on the border of effectiveness for any particular gestation); the latest period in gestation (the 5th day after conception) in which the administration of curative foods ensures the birth of living young; the soly. of the vitamin; its stability toward ultra-violet light, enzymes of wheat germ oil, atm. O₂, sapon. with alkalis, strong acids, hydrogenation, drying, cooking, and extn. from lettuce and animal tissues, and its instability toward Br, Ac₂O, and ashing temp.; steps in its isolation and concn.; and a bibliography. JOSEPH S. HEPBURN

Some digestibility trials on Indian feeding stuffs. II. P. E. LANDER AND PANDIT LAL CHAND DHARMANI. *Memoirs Dept. Agr. India, Chem. Series* 9, 63-83(1927); cf. *C. A.* 19, 1017.—Feeding expts. on bullocks were carried out with wheat bhusa (*Cicer arietinum*), green sarson (*Brassica campestris*) and siloed shisham leaves (*Dalbergia sissoo*). Wheat bhusa alone was not a maintenance ration, the digestibility coeffs. of the protein and ash and the N balance being negative. Shisham silage was also deficient as a maintenance ration. Data are given on the compn. of the whole feeds and of the ash. K. D. JACOB

Blood gases and their relation to the internal secretions of animals kept on a vitamin A and B deficient diet. E. MIYAKE. *Folia endocrinol. japon.* 2, 23-4, 593-641 (1926); *Ber. ges. Physiol. expl. Pharmacol.* 41, 56.—In pigeons and chickens fed on polished rice the plasma CO₂ is increased, in chickens after an initial decrease. In man and dog vitamin B deficiency causes a decrease in CO₂ content and capacity. In both cases oryzanin restores the normal values. The changes resemble those observed in rabbits after the removal of the thyroid or gonads. MARY JACOBSEN

The non-protein nitrogen in certain dairy rations and the partition of nitrogen in the urine produced thereon. W. E. KRAUSS. *J. Dairy Sci.* 10, 400-15(1927).—Data are presented showing the distribution of non-protein N in dairy rations based upon clover and timothy hay, the digestibility of the non-protein N, and its utilization by cows in milk. Included are the results of a study of the partition of the N in the urine collected, while these rations were being fed. The non-protein N in hay and silage varies greatly in different samples, presumably due to the differences in stage of maturity, method of curing, and other factors, and suggests that figures for true protein based on av. analyses are of limited usefulness. The albuminoid N method of the A. O. A. C. is of doubtful accuracy for distinguishing between crude and true protein in feeding stuffs. Dairy rations made up of hay, silage, and grain contain a relatively large amt. of non-protein N, being apparently useful in meeting a part of the protein requirement of a cow in milk. There is no difference in the protein metabolism when timothy hay or clover hay is fed, as indicated by urine analysis. J. C. JURRJENS

The experimental production of stone in the bladder. II. R. MCCARRISON. *Indian J. Med. Research* 15, 197-205(1927); cf. *C. A.* 21, 2500, 2932.—A diet of whole wheat flour, linseed meal, corn flour, salt and calcium phosphate is very potent in causing stone in the bladder and its sequelae. The main faults of the diet are its high content of cereal food and phosphates and its deficiency in vitamin A. F. K.

The experimental production of a new type of goiter unrelated in its origin to iodine. R. MCCARRISON. *Indian J. Med. Research* 15, 247-63(1927).—The basal factor in its causation is a diet contg. more than 60% of white flour or vitamin-poor carbohydrate, 20% or less of protein, with fats and inorganic salts (including iodine) in adequate amounts but no green vegetables or fruits. FRANCES KRASNOW

The mineral metabolism of dairy cattle and swine. E. B. FORBES. *J. Am. Vet. Med. Assoc.* 70, 721-34(1927).—Feeding of bone meal to swine is a means of in-

creasing the strength of the bones and an insurance against rickets and related disorders.

FRANCES KRASNOW

Evidence that nutritional deficiencies are factors in the problems of abortion and sterility in dairy cattle. E. B. MEIGS. *J. Am. Vet. Med. Assoc.* 70, 855-66(1927).—Discussion.

FRANCES KRASNOW

Nitrogen excretion during the addition of carbohydrate to a protein diet. H. FIRGAU, K. HARTMANN AND E. VOIT. *Z. Biol.* 85, 557-66(1927).—The N excretion is changed only slightly, if at all.

FRANCES KRASNOW

Diet and reproduction. II. G. GRIJNS AND K. DE HAAN. *Proc. Acad. Sci. Amsterdam* 29, 873-7(1927).—cf. *C. A.* 20, 3488.

W. D. L.

The fundamental food requirements for the growth of the rat. I. Growth on a simple diet of purified nutrients. I. S. PALMER AND CORNELIA KENNEDY. *J. Biol. Chem.* 74, 591-611(1927).—It has been shown by expts. repeated at intervals covering nearly 5 yrs. that young rats fail to grow normally if at all when fed a basal diet of specially purified casein, dextrin, wheat embryo ext., butter fat, mineral salts, and agar, in proportions presumably adequate for satisfying the growth requirements for protein, energy, mineral elements, and vitamins A and B, and housed so as to repress the natural coprophagistic habits of the species. Conclusion: The requirements for normal growth of the rat involve other nutrients than those usually recognized and incorporated in our basal diet. Further studies suggest a need for vitamin-like factors other than those at present generally recognized. The purification of the protein is an important factor and the basic deficiency or deficiencies can be brought about and augmented by the biol. changes in the digestive tract caused by the suppression of coprophagy. The casein after pptn. from NH_4OH soln. was heated to 80-90° for 2-3 hrs., leached with slightly acidified H_2O for 5-7 days or percolated with distd. H_2O for 4-6 days, extd. with cold 85-90% alc. for about 4 days and with almost boiling alc. for 3 days, then with Et_2O for 2 or 3 days, dried in a steam-heated drying drawer in a current of air and pulverized.

Determination of vitamin A content in liver oil of the dog-fish *Squalus sucklii*. H. N. BROCKLESBY. *Can. Chem. Met.* 11, 238(1927).—Two sets of expts., in which a comparison is made of the vitamin A potency of cod-liver oil and dog-fish liver oil in curing xerophthalmia in white rats, indicate that liver oil from the dog-fish *Squalus sucklii* is a potent source of vitamin A.

N. M. NAVLOR

Dietary requirements for reproduction. XII. The inefficiency of the lactating mother to secrete vitamin B in the milk and the relation of such phenomenon to infant mortality. BARNETT SURE. *Science* 66, 265-6(1927); cf. *C. A.* 21, 2921.—A quantitative biological method for the study of vitamin B requirements for lactation is described. Mothers with litters of 6 are given vitamin-B-free diet until the young reach the maintenance curve, then yeast concentrate as a curative added to the diet. Expts. include addn. of yeast to the diet of the mother and to the diet of the young. Results indicate an optimum requirement of vitamin B for the mother and for the young during different stages of lactation, the amt. depending on the condition of the mother and the age of the young. Infant mortality may have a cause in the inability of the nursing mother to secrete vitamin B quickly and in sufficient quantity into the milk.

Carbon dioxide nutrition of plants. HUGO FISCHER. *Ber. deut. botan. Ges.* 45, 331-9(1927).—Exptl. data are presented to show that the CO_2 content of the atm. is frequently a limiting factor in plant growth. The economic aspects of CO_2 fertilization are discussed.

W. NEWTON

The usefulness of serodiagnosis in plant relationship studies. E. GILG AND P. N. SCHÜRHOFF. *Ber. deut. botan. Ges.* 45, 315-30(1927).—A critical review of expts. designed to prove that plant relationships may be based upon the existence of similar proteins in the seed as established by serodiagnosis.

W. NEWTON

New aspects of the problem of vitamins. BICE NEPPI. *Giorn. chim. ind. applicata* 8, 432-7(1926).—The topics considered are: nature of vitamins, their origin, their classification, liposoluble vitamins, vitamin B, vitamin C, estn. of vitamins. A bibliography is appended.

ROBERT S. POSMONTIER

Net-energy values of corn silage, soy-bean hay, alfalfa hay and oats. E. B. FORBES, WINFRED W. BRAMAN, MAX KRISS, J. AUGUST FRIES, C. D. JEFFRIES, R. W. SWIFT, ROWLAND B. FRENCH AND J. V. MAUCHER, JR. *J. Agr. Research* 34, 785-96(1927).—The net-energy values per kg. of dry matter of corn silage, soy-bean hay, alfalfa hay and ground oats for the maintenance of 2-3-year-old beef steers vary from 1.272 cal. for alfalfa hay to 2.476 cal. for ground oats. The net energy of a feed is much more significant and consistent than is metabolizable energy as a measure of the energy value of a feed in nutrition. The maintenance requirements of net energy of the 3 steers

used as subjects were 1.470, 1.517 and 1.537 cal., resp., per sq. m. of body surface, and 1.818, 1.896 and 1.896 cal., resp., per 100 kg. of live wt. W. H. ROSS

A comparison of the direct measurement of the heat production of cattle with the computation of the heat production by the respiratory-quotient method. R. B. FORBES, MAX KRISS, WINFRED W. BRAMAN AND R. B. FRENCH. *J. Agr. Research* 34, 865-78(1927).—The computation of the heat production of cattle by the respiratory-quotient method, as modified by either Andersen or Krogh (*C. A.* 15, 1556), gives results which agree very well with direct heat measurements. Andersen's and Krogh's methods of computation while somewhat different in theory and while yielding respiratory quotients differing in magnitude and in significance, yield virtually identical values for heat production of cattle. Thus 18 detns. of the computed heat production according to Andersen, divided by the directly observed heat production, differed from a similar value involving Krogh's method by only 0.1 to 0.4% with an av. of 0.24%. W. H. R.

The basal metabolism of mature chickens and the net-energy value of corn. H. H. MITCHELL AND W. T. HAINES. *J. Agr. Research* 34, 927-43(1927).—Expts. upon 10 mature chickens showed that 83% of the gross energy of ground corn is metabolizable by chickens and that the av. heating effect of corn on cocks and non-laying hens is 51 cal. per 100 g. The corn used in the expts. contained 402 cal. per 100 g. and had a dry matter content of 91%. Its metabolizable energy for mature chickens is therefore 3670 cal. per kg. of dry matter and its net energy value, 3110 cal. W. H. ROSS

Utilization of the grain in kafir and cane silage by dairy cows. R. B. BECKER AND WILLIS D. GALLUP. *J. Agr. Research* 35, 279-82(1927).—When dairy cows were fed cane and kafir silage made from fairly mature whole plants, about $\frac{1}{3}$ of the cane seed and over $\frac{2}{3}$ of the kafir grain were voided in the manure. Chem. analyses showed little utilization of nutrients from these whole kernels during passage through the cow's digestive tract. Some ether ext. was digested but only a small percentage of the crude protein was utilized and the effect upon the crude fiber was variable. W. H. ROSS

The relation between the vitamin B contents of the feed eaten and of the milk produced. S. I. BECHDEL AND HANNAH E. HONEYWELL. *J. Agr. Research* 35, 283-8(1927).—A study was made of the vitamin B potency of milk from 3 cows that were fed for over 2 years throughout their growth period on an exptl. ration that was decidedly deficient in vitamin B growth factor. The milk was fed to rats as a supplement to a vitamin-B-free basal ration on levels of 8, 10, 12, 16 and 20 cc. per rat per day. The vitamin B potency of the milk was found equal to that of herd milk from cows receiving a good winter ration. It is concluded that vitamin B in milk is not dependent upon the presence of this vitamin in the ration of the cow and that cattle differ from non-ruminant animals in their ability to grow to maturity, to produce normal offspring and to maintain vitamin B in their milk when forced to subsist on rations deficient in vitamin B. W. H. ROSS

Absorption spectrum of ergosterol in relation to the photosynthetic formation of vitamin D. R. A. MORTON, I. M. HEILBRON AND E. D. KAMM. *J. Chem. Soc.* 1927, 2000-5.—A study of the absorption spectrum of ergosterol (pro-vitamin D) in alc. soln. as a function of the time it has been irradiated with the light of a quartz Hg arc. In a fresh soln., there are bands at 293.5, 289.5 and 270 μ . After irradiation for 90 min. to 150 min. these bands have practically disappeared and a band at 247 μ has become strong. Six hrs.' exposure causes the disappearance of this band. • Antirachitic activity is assocd. with the band at 247 μ , as proved by animal tests. These results suggest that in the large-scale production of vitamin D, the destructive wave lengths near 247 μ should be screened off. A. E. RUARK

The detection and estimation of vitamin A and of vitamin D in cod-liver oil and various food products. FRANK WOKES AND S. G. WILLIMOTT. *Pharm. J.* 118, 752-7, 792-3; *Chemist & Druggist* 107, 30-1(1927); cf. *C. A.* 21, 1293.—Zucker's method (*C. A.* 17, 3360) of detecting vitamin D (by its administration producing acid feces in rats) was found suitable for quant. application in assay methods, also in examg. dried milks and infants' foods contg. them. Attempts to apply the method clinically to children, however, have not proved successful on account of the difficulty of controlling the diet in this case. An advantage of the method applied to rats is that the progress of the cure can be followed from day to day, and the efficacy of the dose ascertained without the animal being killed. Detns. of p_H of different parts of the gastro intestinal tract in rats on various diets, with and without vitamin D, have shown that the significant areas for the action of the vitamin in curing rickets appear to be the cecum and large intestine, thus explaining the specificity of the fecal reaction, and confirming the work of Bergeim on Ca absorption (cf. *C. A.* 20, 3718). The study of color tests for vitamin A showed that true vitamin blue gives characteristic absorption bands at 590

and 617μ ; then the color fades with parallel formation of red or yellow. This differentiates vitamin blue from blue colors given by carotin, xanthophyll and other plant pigments. Removal of the interfering pigments by adsorption with charcoal (Norit) enabled color tests to be successfully applied to a range of animal and vegetable food substances contg. vitamin A, as found by animal expts. Parallel results were obtained. The specificity of the color tests has also been studied in detail. When cod-liver oils are examd. with a specially purified $SbCl_3$ reagent, differences in the stability of the vitamin seem to be detectable by observing differences in the color changes. Recent work on cholesterol derivs. (cf. *C. A.* 20, 2341, 3301; 21, 2017, 2722) indicate the possibility that vitamins A and D may be derivs. of the same parent substance. A list of 41 references is added.

S. WALDBOTT

A note on antimony trichloride and some factors affecting its sensitivity as a reagent for vitamin A. FRANK WOKES AND J. R. BARR. *Pharm. J.* 118, 758-60, 793; *Chemist & Druggist* 107, 31-2(1927); cf. Carr and Price, *C. A.* 20, 3030 and preceding abstr.—The $CHCl_3$ used should be dried with anhyd. $CaCl_2$, and be free from H_2O , $COCl_2$, Cl_2 and HCl . Recryst. the $SbCl_3$ from $CHCl_3$ or other anhyd. solvent and store it in a desiccator. In prepg. the solns. avoid heat which may produce free Cl_2 ; this tends to accelerate the reaction between $SbCl_3$ and vitamin A, thus diminishing the sensitivity of the reagent. The latter is also affected by the gradual sepn. of small quantities of a heavy oily liquid, apparently a soln. of $CHCl_3$ in either $SbCl_3$ or some similar Sb compd., analogous to the solns. of H_2O in $PhOH$ found in acidum carbolicum liquidum. The formation of this oily liquid depends on the presence of H_2O , temp. and exposure to air, which factors must be considered in the prepn. and storage of the vitamin reagent. A list of 14 references is appended.

S. WALDBOTT

Some constituents of citrus fruits. STANLEY G. WILLIMOTT AND FRANK WOKES. *Pharm. J.* 118, 770-3, 793; *Chemist & Druggist* 107, 32-3(1927); with 16 references.—Orange, lemon and grape-fruit have been examd. for their various constituents. In view of the theory that these are produced by photosynthetic action in the flavedo, a comparison has been made between their concn. in the flavedo and in the juice. Vitamins were found in all 3 fruits. In general, the juice contains mostly vitamin C, the grape-fruit rather less than the orange and lemon. Vitamin B, on the other hand, is concd. mainly in the flavedo, in considerable quantities. Vitamin A is present in significant quantities only in the orange, both in peel and juice. These variations in vitamin distribution and content led to a study of factors which might affect the vitamins. In particular, the presence of oxidizing enzymes was considered. The essential oils, obtained by expression or by cold extn., have been examd. chemically, especially in regard to the chemistry of vitamin A. Changes in structure, reaction, enzyme and sugar content during ripening were investigated.

S. WALDBOTT

Some less-appreciated constituents of orange juice. S. G. WILLIMOTT. *Pharm. J.* 118, 773-5, 793; *Chemist & Druggist* 107, 33-4(1927); with 25 references.—Orange juice was long considered mainly as a source of vitamin C, equally potent with lemon juice, and the possible presence of other vitamins was overlooked. When vitamin A was first detected in the juice, the quantity present was rather underestd., probably on account of its partial destruction by oxidation. It is shown that the juice of fresh ripe California oranges ("Sunkist" brand), when carefully collected and used, contains much larger quantities of both vitamins A and B than was previously supposed. Vitamin D appears to be absent, although the juice exerts a beneficial action in rickets.

S. WALDBOTT

Studies of the vitamin potency of cod-liver oil. XXI. The stimulation of reproduction by fat-soluble vitamins. A. D. HOLMES, A. W. DOOLITTLE AND W. B. MOORE. *J. Am. Pharm. Assoc.* 16, 518-27(1927).—The birds were Rhode Island pullets. The tests were carried out for 32 weeks. The oil used had a vitamin content of about 1660 units per g. The birds were fed 0.25, 0.5, 1 and 2 cc. of oil while the controls received none. The factors studied were egg productions, wt. of eggs, blood clots, fertility, hatchability, viability of chicks, broodiness, body wt., mortality, flavor of eggs and flesh of the birds and vitamin content of eggs. The egg production was increased, the wt. of eggs was increased slightly, the no. of blood clots diminished as the oil was increased, the no. of infertile and weak germ eggs was diminished, the hatchability was increased, the viability of the chicks was increased, broodiness was not influenced, body wt. of the high producing birds was not decreased and the mortality among the high test birds was decreased over that of the controls. No detectable flavor was given to the flesh or eggs of the birds. The vitamin potency of the eggs increased over that of the controls.

L. E. WARREN

Microbic virulence and host susceptibility on paratyphoid-enteritidis infection of

white mice. XII. The effect of diet on host resistance. IDA W. PRITCHETT. *J. Exptl. Med.* 46, 557-70(1927).—When 5% of butter fat or cod-liver oil is added to a bread-and-milk diet, in itself adequate to promote the breeding and rearing of a healthy stock of mice through a period of years, the resistance of these mice to *per os* infection with the paratyphoid mouse typhoid bacillus as compared to that of mice on the unmodified diet, is definitely increased. A similar effect may be obtained with a McCollum "complete" diet, even when the butter fat is omitted, and with a bread-and-milk diet in which the milk used has been rayed with a Hg-vapor lamp. When an inactive fat, like Crisco, is added to the bread-and-milk diet, the results obtained are not very clear-cut. While seasonal variations in resistance to mouse typhoid were not completely eliminated by the various modified diets, they were nevertheless reduced, the modified diets tending to stabilize the death rate at a point lower than that usually reached by the mice on the control diet.

C. J. WEST

Nutritive value of fats. III. JUN-ICHI OZAKI. *Proc. Imp. Acad. (Japan)* 3, 439-44(1927); cf. *C. A.* 21, 1478, 1479.—Among satd. fats, laurin and myristin had the highest value; from acetin to myristin, the nutritive value increased with the mol. wt. None of the satd. fats tested was so noxious as isovalerin or undecine. Among unsatd. fats, olein gave the best results; with olein, linolin, linolein and iwashin, the nutritive value decreased with the increase of the no. of unsatd. linkings. Those having an unsatd. linking in the α,β -position were generally less nutritious than the corresponding satd. fats. The only exception was isovalerin, which was better utilized than isovaline. Those fats having a triple bond (like stearolin and undecine) were noxious. In general, the fats contg. fatty acids of an even no. of C atoms were better utilized than those having an uneven no. of C atoms. The lower aldehydes have little nutritive value and some exhibited rather noxious effects; the higher aldehydes (margaric, palmitic and pentadecylic) were tolerably well utilized. The esters were, in general, better utilized than the corresponding glycerides; the Na soaps were as well utilized as the glycerides. The nutritive value detd. by feeding expts. coincides fairly well with the absorption coeff.

C. J. WEST

The composition of the urine of steers as affected by fasting. T. M. CARPENTER. *Am. J. Physiol.* 81, 519-51(1927).—Seven fasts with adult steers (about 600 kg.) and 2 fasts with younger steers (about 250 kg.) were studied. The general trend in the rate of elimination of urinary constituents was a falling off, depending upon the previous ration, with the exception of a rise in inorg. sulfates and a marked increase in urea, noted only in fasts after submaintenance feeding. The fasting base line, or the disappearance of the effect of previous food, was reached by the 4th to 6th day. Min. N excretion of the adult steers was from 1.6 to 1.7 g. per hr., and between 0.064 and 0.075 g. per kg. of the body wt. per 24 hrs. Extensive chem. analysis of the various urinary constituents were made.

J. F. LYMAN

A new standard meal for the determination of the specific-dynamic effect of protein. ALFRED WERNER. *Schweiz. med. Wochschr.* 57, 612-21(1927).—Aleuronat, a plant protein product, was used. This has a compn. of 80-85% protein, 8% water, 3-6% starch, 0.1-1% fat, 2-3% alc. ext., mostly lecithin and 1.2% ash. In the last 2 components there was 0.58% P_2O_5 . The dose of aleuronat was 0.5 to 1 g. per kg. The sp. dynamic effect of protein caused by the min. dose averaged 24%. The peak of the curve was reached in 70% of the cases after the second hr., in 30% after the first hr. Knipping's respiratory exchange app. was used. A bibliography of 60 references is appended.

Some observations concerning metabolic rate in turtles, *Chrysemys marginata belli* and *Chelydra serpentina* (Linn). FRANCES M. BALDWIN. *Am. J. Physiol.* 76, 196(1926).—Three series of expts. on the painted turtle after being kept in the lab.

for a month without food, on the same species direct from its natural environment and on snapping turtles direct from the water, show the av. figures 604.8, 1169.0 and 1490.2 on the cc. kg./ day basis.

J. B. BROWN

Observations upon the action of the parathyroid hormone. N. B. TAYLOR. *Am. J. Physiol.* **76**, 221-2(1926).—Rabbits, guinea pigs and mice were immune to large doses of the parathyroid hormone. During blood Ca rise there are no symptoms, but upon the development of urgent symptoms there is a fall in blood Ca. From 18 to 24 hrs. after the first injection there is a sharp rise in the titratable acidity of the urine with an increase in NH_3 excretion.

J. B. BROWN

The source of oxalic acid in the animal organism. GAETANO VIALE AND STEFANO CASTAGNA. *Arch. sci. biol.* **9**, 365-78(1927).—It is known that under proper conditions glucose may be oxidized to $(\text{COOH})_2$. The metabolism of glucose was therefore studied. Insulin injections do not affect oxalatenia, but decrease the amt. of $(\text{COOH})_2$ excreted. Adrenaline injections, which produce hyperglucemia, also increase oxalate excretions. Pancreatic deficiency has a like effect. Diabetic conditions therefore produce also oxalaturia. However, in diabetes from fluorescein in which glucose does not increase, there is no increase in $(\text{COOH})_2$. It is, therefore, faulty glucose metabolism which produces $(\text{COOH})_2$. Insulin helps the condition by either preventing $(\text{COOH})_2$ formation, or also by catalyzing its further oxidation to H.COOH , and therefore, $(\text{COOH})_2$ metabolism is regulated by the pancreatic secretions and insulin injection is a rational treatment in oxalemia.

A. W. CONTIERI

The distribution of hydrogen ions between erythrocytes and plasma. ALESSANDRO GEIGER. *Arch. sci. biol.* **9**, 447-58(1927).—When the p_{H} is normal physiologically, the H ions in the erythrocytes and plasma are distributed according to Donnan's theory ($\text{H}^+\text{erythrocytes} \times (-)\text{erythrocytes} = \text{H}^+\text{plasma} \times (-)\text{plasma}$). When an acid condition is present, the H ions are distributed according to the above theory only in the hemolyzed corpuscles.

A. W. CONTIERI

Reversibility in chemistry and metabolism with an attempt to formulate living processes. WOLFGANG PONNDORF. *Beitr. klin. Tuberk.* **65**, 184-92(1926).—Recognizing the importance of reversible reactions in chemistry, P. discusses them in living processes and evolves a working hypothesis for correlating this with reversible reactions of metabolism for the purpose of exptl. elucidation of bodily processes. H. J. C.

Action of p_{H} on gaseous exchange in muscle broth with the continuous presence of phosphatization. M. COMEL. *Atti accad. Lincei* [6], **5**, 808-12(1927); cf. C. A. **21**, 2300.—To study further the cause of diminished respiration with diminished p_{H} , phosphatization was maintained throughout a series of liquids with different p_{H} values. This was obtained (1) by different proportions of Na_2HPO_4 and citric acid, and (2) by different combinations and proportions of H_2PO_4 , NaH_2PO_4 , Na_2HPO_4 and Na_3PO_4 , with the same exptl. technic as before. The results are tabulated to show the relations between p_{H} , consumption of O and production of CO_2 . Respiratory exchange diminished rapidly with decrease in the p_{H} of the liquid below a value approx. at the isoelec. point of the muscle protein, i. e., p_{H} around 5. Above p_{H} 5, the results varied somewhat with the means of phosphatization, but active respiration occurred in all cases. In general respiratory exchange was low with p_{H} values at which the protein was in the state of cations, while the optimum exchange was at neutrality. The results indicate that the fundamental factor governing the exchange is the p_{H} value. C. C. D.

Researches on lime in blood. IX. The action of insulin on the blood lime picture. ESKIL KYLIN. *Z. ges. exptl. Med.* **52**, 260-1; *Chem. Zentr.* **1926**, II, 2609; cf. C. A. **21**, 2728.—After injection of insulin the Ca content of the blood diminishes, and since the Ca content of the *duclux thoracicus* increases, this loss may perhaps be the result of a transfer of Ca from the blood to the lymph.

C. C. DAVIS

The lipid phosphorus content and the physiological activity of the submaxillary gland. R. CAMINADE, ANDRÉ MAYER AND H. VALLEE. *Ann. physiol. physicochim. biol.* **3**, 89-93(1927).—The lipid P in the resting submaxillary gland of dogs is very const., averaging in 9 expts. 0.34 g. per 100 g. dry tissue or 0.082 g. per 100 g. fresh tissue. After moderate physiol. activity the changes in P content are only slight. When the gland is excited by pilocarpine, the tissue has an increased H_2O content but no change in P in the dried gland occurs. However, central or reflex nerve stimulation increases the P content of dried gland but does not change its H_2O content.

The physiology of the thyroid gland. F. C. KENDALL. *Atlantic Med. J.* **30**, 609-12(1927).—A discussion of the chem. properties, and the physiol. action of thyroxine in relation to thyroid disturbances.

H. J. DEUEL, JR.

Physiology and pathology of lymph formation. ROBERT MEYER-BISCH. *Ergeb.*

nisse physiol. 25, 574-642(1926).—A review including a résumé of recent work on the chemistry of lymph of factors influencing lymph flow, and of lymphagogs.

H. J. DEUEL, JR.

Electrolytic equilibrium of the blood. Modifications of the equilibrium following intravenous injection of potassium salts. L. CONDORELLI. *Arch. farmacol. sper.* 43, 44-50(1927); cf. *C. A.* 21, 2300.—Salts of K injected intravenously are rapidly withdrawn from the circulation and taken up by the tissues. Injection of KCl results in an appreciable diminution of NaCl. In these phenomena of regulation the liver apparently plays an important part. The lethal effect of KCl injection is dependent not so much on the abs. amt. injected as on the concn. and on the rapidity of the injection. With rapid injection there is not time for the reestablishment of electrolytic equil. and a shock similar to anaphylactic shock results. The symptoms are tachycardia, fall of blood pressure, emission of urine and feces, and finally paralysis of the respiration and of the heart. With more moderate increase in blood K the symptoms of tachypnea, tachycardia and fall in blood pressure are less acute and recovery occurs when equil. is again restored.

A. W. DOX

The rapidity of fixation of calcium injected intravenously in animals with the reticulo-endothelial system free or blocked. L. CONDORELLI. *Arch. farmacol. sper.* 43, 88-96(1927).—Ca injected intravenously is taken up with extreme rapidity by the tissues and within 5 min. disappears from the circulation. The tissues are capable of taking up a large amt. of Ca, so that within the limits of the expts. the amt. thus fixed varied with the quantity injected rather than with the wt. of the animal. In animals in which the reticulo-endothelial system was blocked by means of colloidal Ag no diminution of this Ca-fixing power was observed.

A. W. DOX

The iodine content of the thyroid gland of various types of cattle and its relation to the glandular condition. TH. VON FELLEBERG AND H. PACHER. *Mitt. Lebensm. Hyg.* 18, 265-89(1927).—Analyses of 80 different thyroid glands shows little relation between the I content and other conditions of the gland. The I content generally was not dependent upon the size. In certain bovine species, it varied inversely to the gland size. The abs. I content increased with the weight of the gland. A low I value accompanied a low content of colloidal matter and small follicles. Single species showed different thyroid weights and contents, so that external conditions as environment, climate, I, food, etc., may have more effect than actual glandular condition.

R. C. E.

The effects of variations in p_H on the volume of red cells. A. C. HAMPSON AND M. MAIZELS. *J. Physiol.* 62, 16-8(1926); *Physiol. Abstracts* 12, 23.—In K phosphate soln. the min. vol. is found at p_H 8.1. When more acid, the vol. first increased, then decreased to another min. at p_H 3. When more alk., the vol. increased until hemolysis occurred at 11.0. With const. p_H the vol. increased with diln., except in very acid soln. In acid solns. agglutination occurred. The curves obtained correspond to a Donnan equil.

H. G.

Intermediate carbohydrate and fat metabolism in pregnancy. A. GORTSCHALK. *Klin. Wochschr.* 6, 802-4(1927).—The intermediate metabolism of carbohydrates and fats is abnormal in pregnancy. Ketogenic substances are oxidized in preference to carbohydrates. The pregnant organism does not lose its ability to metabolize carbohydrates. The latter are spared for the rapidly developing fetus.

MILTON HANKE

A new antilucosuric substance that is preformed in the body. Gluchorment. CARL V. NOORDEN. *Klin. Wochschr.* 6, 1041-3(1927).—Pancreas tissue is allowed to autolyze until guanidineacetic acid can be demonstrated in the mixture. The material is then free from water. The dry powder is fed. This powder contains only an insignificant quantity of guanidine derivs. They can hardly be responsible for its activity. The mode of prepn. precludes the presence of insulin. Gluchorment is an effective antilucosuric agent. It does not appear to be toxic.

MILTON HANKE

Calcium content of serum during pregnancy, at the time of birth and postpartum. A. BOCK. *Klin. Wochschr.* 6, 1090-1(1927).—The Ca content of the serum is normal (9.6 mg. %) during pregnancy. Values as low as 9.18 mg. % are obtained just before parturition. The values fluctuate considerably at the time of birth but av. about 9.4 mg. %. There is always a low Ca value postpartum (9.2 mg. %) with a slow recovery to normal during the first week.

MILTON HANKE

Copper in human blood serum. OTTO WARBURG. *Klin. Wochschr.* 6, 1094-5(1927).—Human serum contains 0.001 to 0.002 mg. Cu per cc. The methods of detn. are described.

MILTON HANKE

Glucose, the hormone that stimulates the secretion of insulin. E. GRAFE AND F. MEYTHALER. *Klin. Wochschr.* 6, 1240(1927).—Injection of 3-4 g. glucose in 5 cc. H₂O into the femoral artery, the hepatic artery or the portal vein, leads to a marked

hyperglucemia. A similar injection into the arteria pancreaticoduodenalis leads either to a very slight hyperglucemia, no effect at all or a pronounced hypoglucemia. Glucose is the hormone that stimulates the pancreas to secrete insulin. MILTON HANKE

Ovum and hormone. BERNHARD ZONDEK AND S. ASCHHEIM. *Klin. Wochschr.* 6, 1321-2(1927).—Irradiation of the ovaries of mice destroys the maturing ova and leads to changes in the tissue such that new ova are not produced; but the phenomena of estrual crisis are not inhibited. The maturing ovum is evidently not the stimulus that leads to the production of the ovarian hormone. Conversely, injection of the ovarian hormone does not lead to folliculation or to premature ripening of the ova in infantile mice, although it does lead to estrual crisis. Thallium inhibits the production of ovarian hormone in mice. The ovaries contain maturing ova and large follicles; but there is no estrual crisis. The injection of an ext. of the anterior lobe of the hypophysis leads to an estrual crisis within 100 hrs. The hypophyseal ext. is the activator that leads to corpus luteum formation, folliculation, production of ovarian hormone and, hence, to estrual crisis. MILTON HANKE

Is the amino acid content of the blood changed during the gestation period under normal and under pathological conditions? CARL HELLMUTH. *Klin. Wochschr.* 6, 1507-8(1927).—There is no change in amino acid content of blood during gestation. MILTON HANKE

Hormone production after administration of glucose. IV. Demonstration of insulin in blood after the peroral administration of glucose in man. H. HAUSLER AND R. WEBER. *Klin. Wochschr.* 6, 1521-2(1927).—Administration of glucose leads to an increased secretion of insulin in man. This does not occur if atropine is given prior to the glucose administration. MILTON HANKE

Amount of active principle of the hypophysis present in cerebrospinal fluid in normal and in pregnant women. F. SIEBERT. *Klin. Wochschr.* 6, 1558-60(1927).—Cerebrospinal fluid normally contains a demonstrable quantity of the active principle of the hypophysis. This is somewhat reduced during the last months of pregnancy, remains low during the period of delivery and is elevated during the two weeks after delivery. MILTON HANKE

Estrus in rats after parabiosis. H. ZACHERL. *Klin. Wochschr.* 6, 1614-15(1927).—A "Colioanastomosis" between two female rats has no effect upon their respective estrual periods. Pregnancy in one of the rats does not interfere with the regularity of the estrual periods in the other. Parabiosis of a male with a non-pregnant female soon leads to a complete cessation of estrus in the female. This endures for the entire period of anastomosis and persists for some time after the animals are sepd. Anastomosis of no male females with castrated males or females leads to profound changes in the reproductive organs of both animals. The changes are described in detail. M. H.

Acid-soluble iron in blood serum. GEORG BARKAN. *Klin. Wochschr.* 6, 1615(1927).—Ionizable Fe can be dialyzed out of serum that has been treated with an equal vol. of 0.8% HCl. The iron so liberated represents about 0.4% of the total blood iron and about 6% of the amt. that can be liberated from whole blood by the identical process. MILTON HANKE

Urea formation in the organism. I. Urea formation during liver perfusion and autolysis. GIUSEPPE SUNZERI. *Ann. clin. med. sper.* 16, 207-23(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 60.—The perfusion was made with Ringer soln. and defibrinated blood. There was always an increase of NH_3 after blood perfusion, regardless of whether the liver was removed after feeding or hunger or pancreatectomy with subsequent hunger. Urea was always formed (21.8-51.4%). The max. values were obtained on blood perfusion after feeding, but the faculty of forming urea from parenchymatous tissue was present in any condition. The amt. of urea produced on autolysis of the liver removed during digestion varied, but generally increased with the progress of autolysis. In hunger or after pancreatectomy the urea did not change during autolysis. MARY JACOBSEN

Reinjection of blood of the same organism. II. Modification of a few physico-chemical properties. F. SCIPLINO AND L. LA GRUTTA. *Arch. pathol. sper.* 1, 455-69(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 693-4.—The effect of reinjection into a dog of his own blood or its constituents differs from that of foreign protein injection. The cond. rose after the injection of washed red cells (I) and was lowered by serum (II), whole (citrate) blood and serum contg. both glucose (III and IV) and glucose alone (V). η was increased by defibrinated blood (VI) and (less distinctly) by II; it was diminished by I, III, IV and V. The viscosity was raised by VI and lowered by I to V. The surface tension was lowered by VI, by citrated blood and by citrate soln. and raised by I, II, IV, and whole blood. MARY JACOBSEN

Displacement of the isoelectric points of the plasma and variations of the sedimentation velocity of erythrocytes. P. H. ROSSIER. *Arch. phys. biol.* 5, 222-9(1926).—The sedimentation velocity increases with the p_H of the isoelec. point α . M. J.

Relation between thyroid function and enzyme content of the blood serum. S. NAKAMURA. *Folia endocrinol. japon.* 2, 6-7, 87-119(1926); *Ber. ges. Physiol. expil. Pharmacol.* 41, 99-100.—Thyroid feeding increases the serum trypsin of rabbits and diminishes antitrypsin and lipase. Thyroidectomy reduces the serum trypsin of rabbits and the antitrypsin and mostly also the lipase. MARY JACOBSEN

The effect of internal secretions on the gaseous metabolism and the mutual relations of the internal secretions. K. KITA. *Folia endocrinol. japon.* 2, 15-6, 332-64(1926); *Ber. ges. Physiol. expil. Pharmacol.* 41, 97.—The increase of the respiratory quotient in alimentary hyperglucemia is prevented by *adrenaline* and *pituitrin* and favored by *insulin*. *Thyroxin* promotes the gaseous metabolism in normal and thyroidectomized animals, while *thyreoglandol* has but a slight effect. The action of *adrenaline* is inhibited by large *pituitrin* doses, that of *insulin* by *adrenaline*. *Thyroxin* and *pituitrin* are synergists, particularly with regard to the depression of the R. Q. Changes of blood sugar are detd. not only by mobilization of glycogen but also by the oxidation of sugar. MARY JACOBSEN

Effect of thyroid on the bone growth of young rats. S. NISHIMURA. *Folia endocrinol. japon.* 2, 42-3, 153-220(1926); *Ber. ges. Physiol. expil. Pharmacol.* 41, 100.—Thyroid feeding as well as thyroidectomy inhibits the growth of the long bones as indicated among others by the narrowing of the epiphyseal cartilage. The histological details characteristic of growth disturbances are given. The Ca content of the bone is increased by thyroid feeding and reduced by thyroidectomy, while its wt., vol. and water content are diminished by both. MARY JACOBSEN

An unknown aspect of the physiology of the placenta. G. CHAPPAZ. *Gynecol. et obstet.* 15, 39-43(1927); *Ber. ges. Physiol. expil. Pharmacol.* 40, 828.—In over 50 cases the fetal blood showed a greater f.-p. depression than the maternal: retroplacental artery 0.52°, funicular vein 0.54°, funicular artery 0.56°. MARY JACOBSEN

Physiology of the thyroid and parathyroids. III. The effect of thyroid and parathyroids on the creatine-creatinine metabolism. YOSIZO TAKAHASHI. *Okayama Igakkai Zasshi* 1926, 1171-83; *Ber. ges. Physiol. expil. Pharmacol.* 40, 563.—In dogs thyroidectomy (I) causes a decrease, parathyroidectomy (II) and thyroparathyroidectomy (I-II) a slight increase of blood sugar. The tolerance for intravenously injected glucose is lowered in II and I-II and distinctly increased in I. The hyperglucemia lasts in I longer than either in II, I-II or in the controls. The creatine-creatinine excretion is distinctly promoted by thyroid feeding and substantially lowered in the absence of thyroid. During the stage of latent tetany in II the urine creatine is lowered, while the creatinine remains normal; in I-II both are lowered. In the tetanic stage the creatine-creatinine excretion increases in II and in I-II, that of creatine drops to almost zero. MARY JACOBSEN

Fixation and oxidation of sulfur in the liver. R. GARCIN AND A. LESURE. *Progres med.* 55, 9(1927); *Ber. ges. Physiol. expil. Pharmacol.* 40, 233.—The liver has a high S content, 50% of which is oxidized S. A considerable part is extractable with $CHCl_3$. Proof of S fixation and oxidation is seen in the fact that the total S content of portal blood is higher than that of the hepatic vein, while the reverse obtains for the oxidized S. S is supplied partly by the food and partly by hemolytic processes in the spleen. This accounts for the abnormally high liver S in bronzed diabetes. In liver diseases in which the S oxidation is inhibited an excess of neutral S passes into the blood. M. J.

Function of placenta. I. Carbohydrate metabolism. II. The effect of insulin on the carbohydrate metabolism of isolated and surviving placenta. GIUSEPPE DELLEPIANE. *Riv. ital. ginecol.* 5, 89-100(1926); *Ber. ges. Physiol. expil. Pharmacol.* 40, 828.—Insulin considerably increases the glucolytic (I) and glycogenolytic (II) power of the placenta (Ringer-fetal blood perfusion). In the presence of glucose insulin increases I and lowers II while the glycogen formation is not altered. III. Enzyme action in carbohydrate metabolism attributed to placenta. *Ibid* 216-40.—Considerable glycogenolysis occurs on aseptic autolysis of fresh placental tissue. The absence of glucolysis and glycogen formation indicates that these activities are detd. by a vital function rather than by the action of preëxisting enzymes. Intravenous injections of placental exts. lower the blood sugar. Placental tissue and ext. have a considerable amylolytic power but do not hydrolyze saccharose or lactose. IV. The action of the maternal surface of isolated and surviving placenta on sugar solutions. *Ibid* 328-37.—When the maternal surface of surviving placenta perfused with a sugar-free soln. is brought into contact with a sugar soln. the content of the latter is lowered by 43% while the glucose of both

placenta and perfusate are not affected. With non-surviving placenta the glucose soln. loses only 13.2%, while the sugar content of the placenta is slightly increased. Conclusion: The maternal surface of the placenta shows a selective absorption for glucose. The glucolytic activity of the placenta is limited to the sugar absorbed in this manner. The placenta actively regulates the carbohydrate metabolism between mother and fetus.

MARY JACOBSEN

Influence of placenta on the effect of adrenaline on the puerperal uterus. K. TANI AND F. HAZAMA. *Kinki Fujinkwa Gakkwai Zasshi* 9, 65-70(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 827 8.--A favorable effect of placenta on the involution of the uterus was suggested by the fact that herbivora, like rabbits, eat the placenta after parturition. Feeding of placenta inverted the action of adrenaline, atropine, pilocarpine and BaCl_2 on the isolated rabbit uterus. A closer study of the inverted adrenaline effect led to the conclusion that placenta promotes the involution of the puerperal uterus by stimulating contractions. The action is probably an indirect one, through the ovaries and adrenals.

MARY JACOBSEN

Application of a few physicochemical facts to the analysis of the salivary reflex. A. ČERNÍKOV AND B. BAJANDUROV. *Zurnal eksper. biol. mediciny* 4, 396-418(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 69.--The different effects of repeatedly applied salivary stimuli are in the first instance detd. by the chem. nature of the stimulant. Repeated application of alkalies reduces salivation to zero. Under the same conditions inorg. acids in great dilns. cause a decrease, in higher concns. an increase followed by depression. Org. acids stimulate salivation only in higher concns. Repeated application has the same effect as that of inorg. acids in higher concns. The action of all acids is characterized by a curve with an ascending and a descending limb. Salts of org. and inorg. acids have a slight, nonelectrolytes (sugar, glycerol) no, stimulating action. The cation is the active constituent; H is the most effective. Anions, especially OH , modify the permeability of the lingual mucosa and thus may invert the nature of salivary reflex. By increasing the permeability of the tongue mucosa OH makes stimulation by the otherwise inactive Ca and Mg ions possible. The stimulating effect of acids may be essentially reduced by previous application of Ca. Here too Mg acts as an antagonist of Ca.

MARY JACOBSEN

Endocrine glands and enzymes of the blood. I. The influence of potassium iodide, iodine, and iodated albumin on the catalase of the blood. O. A. STEPPUN AND A. M. TIMOFEEVA. *Trans. Sci. Chem. Pharm. Inst.* 1923, No. 3, 3-18.--Twenty cc. of blood from the vein of a rabbit ear was dild. with 18 cc. H_2O and after keeping in an incubator at 37° for 1-1.5 hrs., 6-cc. portions were poured into small Erlenmeyer flasks. To the first flask 1 cc. of H_2O was added, to the others an equiv. quantity of a soln. of KI 6:1000 and I 3:1000 in a KI soln. of 6:1000 was added. All the flasks were kept in an incubator for 30 min. and the catalase index was detd. by the Bach method. Various quantities of the I solns. were used. The test showed that KI has no influence on the catalase index of the rabbit blood. The I solns. exerted a pronounced influence, decreasing the catalase capacity, even with the lowest concns. Iodated albumin, free from free I, showed the same effects as I.

J. S. JOFFE

The digestion of "intact" plant cells and its significance for the physiology and pathology of digestion in man. I. Introduction. J. STRASBURGER. *Arch. Verdauungskrankh.* 41, 1-11(1927).--Discussion. II. Digestion of starch from "intact" cells. LEO STRAUSS. *Ibid* 11-23.--The starch contained in unbroken cells is digested in the intestine.

FRANCES KRASNOW

Chemical analysis of blood on forty-eight normal individuals. I. CONCEPCIÓN AND M. OCAMPO. *J. Philippine Islands Med. Assoc.* 7, 143-53(1927).--The av. figures obtained were non-protein N 29.1 mg., urea N 14.5 mg., preformed creatinine 1.5 mg., sugar 107.2 mg., NaCl 471 mg., per 100 cc. of whole blood.

FRANCES KRASNOW

The effect of diathermy on metabolism. ZDENKO STARY. *Z. Biol.* 85, 138-50 (1926).--By means of diathermy it is possible to decrease the temp. gradually or to suppress it entirely, thereby lowering the metabolism to a min. with the production of "Vitalwärme" only. If the body temp. is increased through the application of greater amts. of diathermic treatment, the energy exchange is increased despite rapid cessation of application. Although urethan narcosis injures the chem. thermo-regulating mechanism in rabbits, small quantities of diathermic application cause an increase in metabolism. Cf. following abstr.

FRANCES KRASNOW

Effect of diathermy on metabolism. II. Z. STARY AND W. P. STEIN. *Z. Biol.* 85, 551-6(1927).--The qual reactions due to diathermic treatment are the same in man as in rabbits. Quantitatively man suffers a lesser effect.

FRANCES KRASNOW

The effect of thyroid gland extract on the sensitiveness of the cervical sympathetic system. W. E. MAJEWSKY. *Z. Biol.* 85, 342-8(1926).—Physiological. F. K.

Chemical and polarimetric observations on glucose and salts solutions recovered from Thiry-Vella loops. H. L. WHITE AND J. RABINOWITCH. *J. Biol. Chem.* 74, 449-54(1927).—No evidence of a mutarotation of a 2% glucose soln. was found in 30 to 40 min. following a stay of 10 min. in the intestinal loops of 2 Thiry-Vella fistula dogs. Hewitt and Pryde's findings (*C. A.* 14, 3098), from which they infer a γ -glucose formation, are thus not confirmed. The dogs used had been operated on about 4 months before the expts. were performed and were in excellent condition. A. P. L.

The fate of sugar in the animal body. VII. The carbohydrate metabolism of adrenalectomized rats and mice. C. F. CORI AND GERTY T. CORI. *J. Biol. Chem.* 74, 473-94(1927); cf. *C. A.* 21, 3071.—A study has been made of the influence of insulin on the carbohydrate metabolism of animals without, or at least with the min. of, epinephrine secretion, since several reports have been made to the effect that insulin injections lead to an increased discharge of epinephrine. "When rats surviving double adrenalectomy were subjected to a 24-hr. fast, the liver glycogen disappeared and the blood sugar fell considerably below normal. In contrast to the liver glycogen, the glycogen content of the muscles of these animals remained the same as that of normal control rats fasted for the same length of time. The low blood sugar is linked with the lack of liver glycogen, since the muscle glycogen does not participate in blood sugar regulation. The absence of liver glycogen in fasting adrenalectomized rats is not the result of a disturbance in the synthesis of sugar into glycogen, since liver glycogen is formed at the normal rate when glucose is fed. Twenty-four fasting adrenalectomized rats absorbed glucose at a much slower rate than 24-hr. fasting normal rats. During 4 hrs. of glucose absorption the adrenalectomized rats *without insulin* oxidized 373 mg. of glucose and formed 270 mg. of glycogen (124 mg. in the liver and 146 mg. in the rest of the body). The adrenalectomized rats *receiving insulin* injections oxidized 471 mg. of glucose and deposited 37 mg. of glycogen in the liver and 185 mg. in the rest of the body. The difference in liver glycogen corresponds closely to the difference in glucose oxidation of 98 mg., while the glycogen deposition in the rest of the body (chiefly muscles) is not materially changed. The same results have been obtained previously on rats with intact adrenals, where a discharge of epinephrine in sufficient amts. to produce a metabolic effect could not be excluded. Since the adrenals were absent in the present expts., the conclusion has been drawn that the lessened deposition of liver glycogen and the increased sugar oxidation, also to be observed in insulinized rats with intact adrenals, are due to insulin alone and not to a combined action of insulin plus epinephrine. Previous expts. have shown that insulin injections lead to a decrease in the liver glycogen of fasting insulinized mice. An identical result has been obtained on mice from which both adrenals had been removed 20 to 30 days previously. The adrenalectomized mice without insulin showed 2.16% liver glycogen after a fasting period of 1-5 hrs. The adrenalectomized and insulinized mice that were killed simultaneously showed only 0.79% liver glycogen. Since the effect of insulin on the liver glycogen of fasting animals is the same, whether or not the adrenals are present, there is no need to assume that epinephrine is responsible for the decrease in liver glycogen following insulin injections."

A. P. LOTHROP

The nitrogenous constituents of hen urine. R. E. DAVIS. • *J. Biol. Chem.* 74, 509-13(1927).—Urine was obtained by a special technic so that it was uncontaminated by feces. In 14 expts. with 5 hens the following min., av. and max. per cents of the total N were obtained for certain of the nitrogenous constituents, resp., uric acid N 59.4, 62.9 and 69.5; NH_3 N 14.9, 17.3 and 19.5; urea N 9.2, 10.4 and 11.2; creatine-creatinine N 7.1, 8.0 and 9.1. The av. abs. amts. in mg. per 100 cc. of urine were as follows: total N 100, uric acid N 62.9, urea N 10.4, NH_3 N 17.3, creatine-creatinine N 8.0, undetd. N 1.4. Since an unknown amt. of reabsorption of urea, creatine and creatinine probably occurs in the cloaca of the hen, it does not seem practical to calc. urinary N from the amt. of uric acid in hen droppings by multiplying uric acid N by some factor.

A. P. LOTHROP

The effects of respiratory gases upon the density of blood and other fluids. W. F. HAMILTON AND H. G. BARBOUR. *J. Biol. Chem.* 74, 553-6(1927).—Whole blood, serum, alk. salt soln. (NaCl 0.7 and NaHCO_3 0.2%) and H_2O were equilibrated with various mixts. of CO_2 , N_2 and O_2 . A given amt. of CO_2 increased the density in this order: H_2O < alk.-salt soln. < serum < blood. O_2 caused a still greater increase. The effect is explained on the assumption that when CO_2 goes into the liquids, it changes their resp. vols. to a different extent. In serum the formation of acid-protein results in more compact mol. arrangements. The shrinkage which occurs when O_2 is added to whole blood

indicates that oxyhemoglobin has a more compact mol. than reduced hemoglobin.

A. P. LOTHROP

The plasma proteins of normal dogs. C. W. MATTHEW. *J. Biol. Chem.* **74**, 557-60(1927).—The min., av., and max. concn. of the plasma proteins in 50 normal dogs were, resp., total protein 6.56, 7.23 and 8.17; fibrin 0.33, 0.45 and 0.68; albumin 4.13, 4.64 and 5.57; globulin 1.78, 2.12 and 2.90; plasma vol. 42.1, 60.0 and 74.4%. The proteins remain const. in any one animal for several days. Venous blood was drawn from the heart by cardiac puncture, thereby eliminating stasis which has been shown to increase the concn. of the plasma proteins.

A. P. LOTHROP

Effects of dialysis and of ether extraction on the diffusibility of calcium in human blood serum. R. F. LOEB AND EMILY G. NICHOLS. *J. Biol. Chem.* **74**, 645-9(1927); cf. *C. A.* **20**, 1244.—A comparative and simultaneous study of Ca concns. at equil. in a dialysis system has been made on human sera divided into the following fractions: whole serum, the same serum rendered Ca-free by preliminary dialysis, the same whole serum extd. with Et₂O. The observed Ca concns. in all 3 fractions are considerably higher than can be accounted for by the Donnan equil. The deviation appears to be slightly greater than in whole sera with the Et₂O-extd. sera and slightly lower in the fractions rendered Ca-free by preliminary dialysis. The results substantiate the idea that there are unionized Ca-protein complexes in human sera and that if there are any non-protein factors present their influence must be quant. very small.

A. P. L.

The effect of adrenaline on phosphorus partition in muscle. J. SACKS. *Am. J. Physiol.* **81**, 276-9(1927).—The injection of adrenaline into rabbits produced a marked increase in inorg. P of the muscle, but little or no change in inorg. P + lactacidogen P.

J. F. LYMAN

The effect of the follicular hormone on old albino rats. J. R. SLONAKER. *Am. J. Physiol.* **81**, 323-35(1927) The hormone did not prolong the productive sexual life by inciting ovulation, but it did stimulate mating activities.

J. F. LYMAN

The thyroid apparatus. XLVII. The cyclic character of the response to parathyroid deficiency. F. S. HAMMETT. *Am. J. Physiol.* **81**, 349-54(1927); cf. *C. A.* **21**, 2020.—Body growth and tooth calcification in the parathyroidectomized rat run a cyclic course of retardation and acceleration.

J. F. LYMAN

Muscle glycogen as a source of blood sugar. S. SASKIN. *Am. J. Physiol.* **81**, 382-91(1927).—After removal of the liver the blood sugar level steadily fell and was not raised by the administration of Et₂O, adrenaline or by asphyxia. Muscle glycogen does not appear to be available as a source of blood sugar in the absence of the liver.

J. F. LYMAN

The alleged antagonistic action of the internal secretions of the pancreas and the thyroid. H. WOLFSON. *Am. J. Physiol.* **81**, 453-9(1927).—There was no disappearance of the symptoms of pancreatic diabetes following thyroparathyroidectomy.

J. F. LYMAN

The regulation of respiration. IX. The relation of tissue acidity and blood acidity to volume flow of blood as illustrated by hemorrhage and reinjection. A. B. HERTZMAN AND R. GESELL. *Am. J. Physiol.* **81**, 563-78(1927); cf. *C. A.* **21**, 2926.—Hemorrhage elicited increased alk. of the arterial blood of anesthetized dogs, increased the acidity of the venous blood, decreased O₂ consumption and increased pulmonary ventilation. Reinjection increased the acidity of the arterial blood and decreased the acidity of the venous blood. This was accompanied by increased O₂ consumption and decreased pulmonary ventilation. Hemorrhage probably increased the acidity of and reduced oxidation in the respiratory center. The theory of acid control of respiration is supported.

J. F. LYMAN

The role of tissue in maintaining acid-base equilibrium of blood. I. The effect of isolated muscle tissue. L. N. KATZ AND M. G. BANUS. *Am. J. Physiol.* **81**, 628-43(1927).—Blood perfused through the isolated gastrocnemius muscle of the dog showed no measurable exchange of Cl or bases between the blood and the muscle, even though the blood used had been acidified with HCl. A lack of permeability of the muscle tissue is indicated. A new form of perfusion app. is described. II. Effect of hind leg preparation. M. G. BANUS AND L. N. KATZ. *Ibid* **81**, 644-9(1927).—When the isolated hind leg of the dog was perfused with whole blood acidified with HCl a decrease in acidity and CO₂-combining power was noted. Some of the tissues of the hind leg, not muscle, increase the buffering capacity of the blood perfused through them.

J. F. LYMAN

The effect on the circulation in man of rebreathing different concentrations of carbon dioxide. J. D. GOLDSTEIN AND E. L. DUBOIS. *Am. J. Physiol.* **81**, 650-60

(1927).—The systolic pressure, the diastolic pressure and the heart rate showed a characteristic relationship to the changes in the alveolar CO_2 tension. J. F. L.

Attempts to increase experimentally the hormone output of the thyroid gland. L. HEKTOEN, A. J. CARLSON AND R. SCHULHOF. *Am. J. Physiol.* 81, 661-4(1927).—In expts. on 9 dogs, sympathetic nerve stimulation, direct thyroid massage and intravenous administration of adrenaline and pilocarpine failed to increase the thyroglobulin in the blood of the thyroid vein above that of the variations in the controls. In one expt. stimulation of the sympathetic nerve was followed by an increased thyroglobulin concn. greater than in the controls. J. F. LYMAN

Gastric digestion. The relation of volume, hydrogen-ion concentration and buffer capacity of the test meal to gastric contents. W. A. STANDISH, G. R. COWGILL AND A. T. SHOHL. *Am. J. Physiol.* 81, 696-706(1927).—Expts. on 2 dogs with gastric fistulas and using test meals of milk powder (Dryco) in water showed that gastric secretion produces stomach contents with an acidity between p_H 4.1 and 3.9 in 30 min. The amt. of 0.1 N HCl secreted in the first 30 min. of digestion varied between 28 and 112 cc. Since all meals reached approx. the same p_H at the same time a regulatory mechanism is indicated, whereby secretion is inhibited after a definite acidity is reached. Also the vol. and buffer value of the meal must have a direct influence on the amt. of secretion of gastric juice. As the contents left the stomach, materials of nearly const. compn. remained until the end of digestion was approached. A given meal is most rapidly digested when it is concd. in small vol. J. F. LYMAN

Kidney function. I. Renal excretion with special reference to Ambard's laws. B. S. WALKER AND A. W. ROWE. *Am. J. Physiol.* 81, 738-54(1927) —The first law of Ambard was correct within certain rather narrow limits; the second proved completely invalid; while the third law, a combination of the 2, fitted the data approx., viz., $Ur / \sqrt{D \times 70/P} \times \sqrt{C} \sqrt{25} = K$. Ur = g. urea per l. blood plasma, D = g. urea excreted per 24 hrs., P = body wt. in kg., C = g. urea per l. urine. II. The relation of blood to urine urea. *Ibid* 755-64.—Data of the writers and others have been subjected to statistical analysis and a mathematical expression for the curve of elimination of urea was derived, viz., $Ur = 0.340D^{0.72379}$. A test of renal efficiency is proposed as follows: The urine collection is made over a period of 1 or 2 hrs. Blood is taken at the middle of the period and urea detd. in blood and urine. The index figure is calcd. from the formula $\sqrt{D}/Ur \times 7.5 = \text{Index}$. D = g. urea per 24 hrs. Ur = g. urea per l. plasma. Normal individuals have an index of 100 or over. An index below 75 is regarded as abnormal; while an index between 75 and 100 is suspicious. J. F. LYMAN

The failure of histamine to induce estrous changes in spayed rats. P. M. LEVIN. *Am. J. Physiol.* 82, 19-21(1927).—The use of histamine offers nothing positive concerning the action of the estrous-inducing principle. J. F. LYMAN

The physiology of the pancreas. III. A hormone for external pancreatic secretion. A. C. IVY, J. I. FARRELL AND H. C. LUETH. *Am. J. Physiol.* 82, 27-33(1927); cf. *C.A.* 21, 164.—The application of acid (0.1 N to 0.05 N HCl) to transplanted loops of jejunum excited secretion in pancreatic transplants. This is thought to prove that acid causes the intestinal mucosa to give off a hormone for external pancreatic secretion. J. F. L.

Absorption from serous cavities. VI. The effect of ligation of the mediastinal lymphatics on absorption from the peritoneal cavity. R. S. CUNNINGHAM. *Am. J. Physiol.* 82, 59-62(1927).—The fact that obstruction of the lymphatic drainage of the diaphragm had no effect on the absorption of isotonic solns from the peritoneal cavity indicates that the absorption of such solns. takes place through the blood vessels. J. F. LYMAN

The role of the hypophysis in the initiation of labor. H. B. VAN DYKE AND A. KRAFT. *Am. J. Physiol.* 82, 84-90(1927).—Cerebrospinal fluids from pregnant women showed no increase in oxytocic substance with the progress of gestation. J. F. L.

Regulation of respiration. X. Effects of carbon dioxide, sodium bicarbonate and sodium carbonate on the carotid and femoral flow of blood. D. W. BRONK AND R. GESELL. *Am. J. Physiol.* 82, 170-80(1927); cf. *C. A.* 21, 2926.—Administration of CO_2 increased the blood flow in the carotid and decreased the femoral circulation. Both NaHCO_3 and Na_2CO_3 increased the carotid and femoral flow of blood. J. F. L.

The occurrence of complex carbohydrates in the blood. I. The effect of takadiastase and emulsin on the reducing power of the blood. E. GABBE. *Biochem. Z.* 187, 57-71(1927).—The reducing power of the blood from humans and rabbits increases 30-40% under the influence of takadiastase. This increase is observed only when whole blood is studied, and not with isolated plasma. If red cells alone are used the increase is much more significant. The substance which undergoes hydrolysis with

takadiastase remains intact when the corpuscles are washed 3-6 times with isotonic NaCl. Expts. with emulsin give practically the same results but not as pronounced as with the takadiastase.

S. MORGULIS

Observations on the gastric secretion in health. T. A. BUTCHER. *Quart. J. Med.* 19, 455-78(1926).—The curve of pepsin secretion corresponds in shape to that of free HCl when this is present. The pepsin curve does not give a true indication of the quantity of pepsin present unless all samples are brought to the same acidity. If this is done the curve is proportional to the quantity of gastric secretion and conforms in shape to that of the total chlorides. Pleasing psychic stimuli increase the secretion of both pepsin and HCl. Nausea and distaste may cause a great diminution in secretion. Atropine by mouth, before a gruel test meal or before psychic stimulation, diminishes the secretion of both pepsin and HCl.

JOHN T. MYERS

Coagulation of blood. H. DE WAELE. *Presse méd.* 90, 1110(1926); *Colloïdes biol. clin. therap.* 1, 79; *Ann. physiol. phys. chim. biol.* 3, 94-112(1927).—D. considers that the fibrinogen of the blood is a fibrinogenate of Ca, or preferably of Ca and Na. The proportions of these cations are a function of the p_H . The soly. of these complexes exhibits a min. towards $p_H = 4$ and another towards $p_H = 7-9$. Evolution of CO_2 with the consequent alkalization gives a p_H of slightly over 7.4, at which the fibrinogen is less sol., and results in the formation of a gel.

A. PAPINEAU-COUTURE

The thiopepsic and thio-oxidizing function of the liver. M. LOEPER, R. GARCIN AND A. LESURE. *Prog. méd.* 1927, No. 1, 9; *Bull. soc. hyg. aliment.* 15, 108(1927).—The S present in the liver comes from ingested food through the intestines and mesenteric vessels, and from hemolysis through the spleen. Nearly 50% of this S is oxidized, which is a much higher proportion than is usually found in the other organs. The fixation and oxidation of S by the liver is also shown by comparative analysis of blood from the portal and subhepatic veins. The S is partly used by the liver in building up its pigment.

A. PAPINEAU-COUTURE

The prenatal growth of the mouse. E. C. MACDOWELL, E. ALLEN AND C. G. MACDOWELL. *J. Gen. Physiol.* 11, 57-70(1927).—The course of prenatal growth in the mouse, guinea pig and chick can be expressed as a linear relation between the logs. of wt. and age only when age is counted from the beginning of the embryo proper. Growth prior to the embryo proper is essentially different than after that time. Methods are described, and other physiol. results are given.

C. H. R.

Microchemical studies on the nervous system. Sulfur and phosphorus content of the cerebral hemispheres of the guinea pig. R. M. MAY. *Compt. rend.* 185, 368-70(1927).—Detns. of S and P by recent micro-methods in the cerebral hemispheres of the guinea pig show practically the same content in each hemisphere. This fact releases one hemisphere for other detns.

L. W. RIGGS

Liquid exchange. II. Venous obstruction edema in dogs with sound and with diseased kidneys. TOMOTAKA YAMAGUCHI. *Tohoku J. Exptl. Med.* 9, 73 110(1927); cf. C. A. 21, 2929.---The conditions under which blood becomes concd. by the passage of some of its constituents into the tissue liquid, or dild. by the passage of more dil. tissue liquid into the blood, are discussed.

L. W. RIGGS

The arginine content of spleen. V. S. GULEVICH AND S. YA KAPLANSKIĖ. *J. Russ. Phys.-Chem. Soc.* 58, 620 2(1926).—Fresh exts. of bovine spleen were treated according to Gulevich and Yohkelson (*Z. physiol. Chem.* 30, 533(1900), no arginine being found. Autolysis of the spleen liver and muscle tissue at room temp. was followed by making non-protein N detns. at intervals. Muscle showed a 3.4% gain in N content in 9 hrs.; liver, 2.4% in 6 hrs., and spleen, 2.2% in 3 hrs. (8.8% in 6 hrs.). The presence of arginine reported by G. and Y. (*Ibid*) was due to the autolysis of spleen tissue during several days' standing at room temp.

BASIL C. SOYENKOFF

The origin of heat of muscle contraction. O. MEYERHOFF AND K. LOHMANN. *Naturwissenschaften* 15, 670(1927); cf. C. A. 20, 1261.---During muscle activity primary heat of 390 cal. per g. lactic acid (anaerobic) is evolved. The glycogen into lactic acid transformation during this phase has only a 185 cal. heat effect, calorimetrically detd. in cut-up muscle. The surplus heat can be partly explained up to 80 cal. by deionization heat of the alkali protein; the remainder of about 120 cal. was so far unaccounted for. It was now found that the labile phosphagen (phosphate-creatine compd.) in the muscle, which could be isolated to 90% purity and was found to consist of $(OH)_2O.P.NH.C(NH).N(CH_3).CH_2.CO_2H$ (mol. wt., titration and kinetic evidence), evolves 150 cal. per g. of phosphoric acid on enzymic cleavage. During muscle activity the ratio of phosphagen decompn. to lactic acid formation is not const. but decreases with increasing fatigue, being initially 1.5 (g. H_3PO_4 : g. lactic acid). For moderate fatigue, 0.2% lactic acid, the ratio is 0.75, which corresponds to an additional heat evolution

of between 120 and 130 cal. per g. lactic acid. Apparently, at least for vertebrae, the energy for anaerobic muscle work is partly due to phosphagen cleavage and not solely to carbohydrate decompn. In lobster muscle a substance of similar chem. and physiol. properties was found. It is characteristic of the phosphagen cleavage that on addn. of O the substance is regenerated.

Histological evidences of colloid absorption directly by the blood vessels of pars anterior of the human hypophysis. A. T. RASMUSSEN. *Quart. J. Exptl. Physiol.* 17, 149-55(1927).—Colloid in the blood vessels was revealed in only 2 of 100 hypophyses examd.

The reaction of human mixed saliva. G. J. RICH. *Quart. J. Exptl. Physiol.* 17, 44-56(1927).—Fresh human saliva, taken under conditions to prevent the loss of CO_2 , is very close to neutral but it is more often acid than alk.

The excretion of water by the kidneys of frogs. E. F. ADOLPH. *Am. J. Physiol.* 81, 315-24(1927).—At 20° the av. normal rate at which frogs excreted H_2O (immersed in tap water) was 1.3% of their wt per hr. This rate was doubled or trebled for every increase in temp. of 10° . At 1° very little urine was secreted. Frogs removed from water to moist air formed no urine. Placed in solns. of NaCl of varying concns. up to 0.1 M there was no effect of the salt on urine formation. Frogs urine was very dil. and never hypertonic to the blood plasma.

Inorganic elements of the plasma in dogs deprived of the hypophysis. P. MAZZOCCO. *Compt. rend. soc. biol.* 97, 594-5(1927); cf. *C. A.* 16, 1458.—The differences in the NaCl, P, Ca, Mg, K and Na contents of plasma in hypophysectomized dogs and controls were not significant.

Carbohydrate metabolism and the formation of ammonia in the blood. ALFRED GIGON. *Schweiz. med. Wochschr.* 57, 294-6(1927).—A relatively small dose of NH_4Cl in healthy rabbits produced a slight decrease of the blood C and N, an increase of the water, a hyperglucemia and acidification of the blood. There was a large increase in the ammoniacal N after NH_4Cl orally. After feeding $(\text{NH}_4)_2\text{CO}_3$ there was a decrease of the blood C and N, an increase of the sugar and ammoniacal N and a decrease of the blood p_{H} . Grape sugar injections increased the blood C and the blood N fell, accordingly decreasing the ammoniacal N. Glucose injections stopped the action of $(\text{NH}_4)_2\text{CO}_3$ and rapidly decreased the ammoniacal N. Urea given orally to both well rabbits and those with kidney disease increased the NH_3 in the blood. In the animals with renal disease the urea increased the blood C and N, the increase in ammoniacal N being much more evident than in normal animals. Sugar injections also stopped the action of urea.

R. C. WILLSON

G—PATHOLOGY

H. GIDEON WELLS

The effect of thyroid on calcium metabolism. C. W. HEATH, W. BAUER AND J. C. AUB. *Proc. Soc. Exptl. Biol. Med.* 23, 699-700(1926).—Patients with exophthalmic goiter and normal controls were given a diet deficient in Ca, 0.1 g. per day, but adequate in calories. Patients with a high basal metabolic rate had a very high Ca excretion; this decreased as the metabolism approached normal. One myxedema patient had a low Ca excretion; this increased when the basal metabolic rate was raised by thyroid and thyroxin. In all subjects the blood Ca and P were normal.

A study of parathyroidectomized rabbits. J. B. COLLIP. *Am. J. Physiol.* 76, 219(1926).—Since rabbits have been found to be relatively immune to the parathyroid hormone, a study of the blood chemistry of these animals has been made. Removal of parathyroids results in early tetany and death. Intravenous injection of the hormone will either delay tetany or, if it has already set in, will be followed by immediate relief. After removal of the glands there is a fall in blood Ca with no change in P. Injection of the hormone causes a maintenance of normal Ca. Massive doses of the hormone cause a blood Ca rise, but in normal rabbits this response is variable.

The occurrence of Liesegang's rings in serological precipitation. L. REINER AND H. KOPP. *Kolloid-Z.* 42, 335-8(1927).—Previous workers have explained the occurrence of double bands of ppt. when the soln. of antigen is placed over the antiserum on the assumption that the 2 bands are of different compn., one of them being the ppt. formed by the action of a protein and its antiserum and the other the ppt. of a lipid and its antiserum. It is now shown that the same double bands can be obtained even if the lipoids are first extd. from the reacting materials. Sometimes 3 or 4 bands are formed. Moreover double rings can be made with recrystd. egg albumin and an antiserum made by means of it. The double ring formation therefore has nothing to do with

the presence of lipoids or the pptn. of different chem. compds. but is merely a case of Liesegang's rings. F. L. BROWNE

The precipitin reaction of fibrinogen. LUDVIG HEKTOEN AND W. H. WELKER. *J. Infectious Diseases* 40, 706-12(1927).—The fibrinogens of beef, dog, horse, human, sheep and swine blood are precipitinogenic. These together with those of the goat, guinea pig, rabbit and rat have antigenic properties in common. Consequently, fibrinogen is not necessarily wholly different for each of these species, as seems to be the case with serum proteins and hemoglobin. While the mammalian fibrinogens just mentioned are not strictly species-specific, there appears to be also some relationship between them and chicken fibrinogen. This fact suggests that mammalian and bird fibrinogens are not wholly distinct and different. It seems probable that as it is possible to obtain precipitin serum that is practically specific for blood fibrinogen, the precipitin test may prove to be of value in efforts to trace the origin of fibrinogen and its relations to other substances. PAUL R. CANNON

The isolation, purification and chemical nature of immune hemolysins. SUSUMA UCHIDA. *J. Infectious Diseases* 40, 588-96(1927).—Extn. of sensitized sheep and human erythrocytes with a 10% soln. of saccharose and 5.6% soln. of dextrose leads to a slight degree of dissoen. The degree of dissoen. is influenced by the amt. and temp. of the dissoec. fluid, but not by the period of dissoen. nor by a weakly alk. dissoec. fluid. A nearly pure hemolysin was obtained by extg. with pure ether, dialyzing and salting out, indicating that the hemolysins are not lipoidal and are non-dialyzing colloids. PAUL R. CANNON

The isolation, purification and chemical nature of typhoid antibodies. SUSUMA UCHIDA. *J. Infectious Diseases* 40, 597-604(1927).—U. isolated anti-typhoid agglutinins and complement-fixing antibody from sensitized organisms by dissoen. with a 10% saccharose soln., the reaction occurring best at 60° for 20 to 30 min. Slight alkalization increased the degree of dissoen., whereas HCl reduced it. By means of a "salting out" method, dialysis and concn., solns. contg. the above antibodies were obtained free of sugar and salt but contg. about 4.8 to 8.4 mg. of total N per 100 cc. and a doubtful trace of protein. PAUL R. CANNON

Serum antilysins and methods for their removal. SUSUMA UCHIDA. *J. Infectious Diseases* 40, 605-9(1927).—Uric acid and cholesterol are more anticomplementary than urica, creatinine, creatine, glucose and bilirubin. Adsorption of anti-complementary serums with kaolin, blood charcoal, infusorial earth, BaSO₄ and corpuscles is of no practical value in relation to complement-fixation tests. Changes in the H-ion concn. of anticomplementary serums are without appreciable influence upon thermostable antilysins. PAUL R. CANNON

Removal of anticomplementary substances with hydrochloric acid (Sach's method). SUSUMA UCHIDA. *J. Infectious Diseases* 40, 610-14(1927).—The Sach's method of testing anticomplementary serums completely removed the thermostable antilysins from about 55% of the serums and reduced their amts. in the remaining 45%. Some of the Wassermann antibody was removed in all of the syphilitic serums tested. U. considers the method of practical value in Wassermann tests of slightly anticomplementary serums which contain large amts. of antibody. PAUL R. CANNON

Specific skin and testis reactions with culture filtrates of *Coccidioides immitis*. E. F. HIRSCH AND MARRIET BENSON. *J. Infectious Diseases* 40, 629-33(1927).—The growth of *Coccidioides immitis* in liquid media liberates a sol. sp. substance which in animals infected with *Coccidioides immitis* and in patients with coccidioidal granuloma causes skin reactions like those occurring with tuberculin in tuberculous animals. This sol. sp. substance is not destroyed by heating to 80° for 30 min. Prolonged electro-dialysis of the synthetic medium filtrate causes the sepn. of white floccules which dissolve readily in distd. water contg. a few drops of 0.01 N NaOH and the solns. cause skin reactions like the original filtrate. PAUL R. CANNON

The specific substance of *Coccidioides immitis*. E. F. HIRSCH AND DOROTHY D'ANDREA. *J. Infectious Diseases* 40, 634-7(1927).—From a synthetic protein-free culture filtrate of *Coccidioides immitis* a sp. substance contg. N and carbohydrate is recovered which in high diln. causes skin reactions in a patient with coccidioidal granuloma. The dried sp. substance is a white powder readily sol. in H₂O, 0.9% NaCl soln., dil. alkalies and acids, contains about 3-4% N, and on dialysis, 20-40% reducing sugar measured as dextrose. The osazone soln. resembles in structure the dextrosazone. PAUL R. CANNON

The preparation and precipitin reactions of egg albumin and blood proteins of the domestic fowl. LUDVIG HEKTOEN AND A. G. COLE. *J. Infectious Diseases* 40, 647-55(1927).—According to the precipitin reaction, albumin can be sepd. from the

other principal proteins of chicken blood plasms by $(\text{NH}_4)_2\text{SO}_4$ pptn. and dialysis, but this method seems incapable of bringing about a complete sepn. of euglobulin and pseudoglobulin. It is also difficult, if not impossible, completely to sep. fibrinogen from euglobulin by this method. There is a definite immunological relationship between the albumins of egg white and of chicken blood and the albumin of egg white may be resolved into several fractions which differ widely in their reactions with precipitin serum for blood albumin.

PAUL R. CANNON

The relationship between the intracellular globulin and the toxin of *Cl. botulinum*. C. I. NELSON. *J. Infectious Diseases* 41, 9-12(1927).—N. concludes that the toxin of *Cl. botulinum* is elaborated within the cell in intimate assocn. with the characteristic bacterial globulin; its appearance in the surrounding medium is assocd. with the globulin with which it is still bound, and is accompanied by cell mortality or disintegration, so that in this sense the toxin is not in itself a true secretion; and the toxin is evidently not identical with the intracellular globulin since it can be freed of the assocd. globulin by peptic digestion.

PAUL R. CANNON

Fat metabolism of the lung with consideration of the pneumothorax lung. R. H. BERG. *Beitr. klin. Tuberk.* 64, 718-25(1926).—The differences in the morphologic appearances of intravenously and intratracheally injected cod-liver oil as well as fed oil were studied in the normal and pneumothorax collapsed rabbit's lung. There was found histologic evidence of a more rapid disappearance of the fat from the pneumothorax lung as compared to the normal lung.

H. J. CORPER

The prognostic value of the urochromogen reaction, blood sedimentation rate and blood picture for the sanatorium. BECKER. *Beitr. klin. Tuberk.* 64, 726-33(1926).—The positive urochromogen test as an index of increased protein destruction occurs only in the final stages of tuberculosis, with a possible exception of individual cases of transient perifocal inflammation. The use of K persulfate in place of the highly colored KMnO_4 as a test reagent is advised. In addn., the blood sedimentation quotient and white blood picture are recommended as prognostic aids. The Wahl-Schömborg quotient $--a/(b-a)$ (a being the one-hr. and b the 2-hr. value) when above 1 is favorable and below unfavorable prognostically. In detg. the white blood picture the monocytes must also be considered according to Junker, a diminution below 5% being unfavorable.

H. J. CORPER

The use of the Costa reaction for the activity diagnosis of pulmonary tuberculosis. E. LADBECK. *Beitr. klin. Tuberk.* 64, 766-8(1926).—The Costa flocculation reaction can be used as a substitute for the sedimentation reaction in the absence of sufficient blood or lack of a suitable vein. 1.5 cc. of a 2% novocaine soln. in physiol. NaCl is placed in a centrifuge tube and 3 drops of 5% Na citrate added; 3 drops of blood from the finger is allowed to fall into the mixt. which is centrifuged or allowed to stand 12 hrs. until the corpuscles have completely settled out; 1 drop of pure HCOH soln. is then dropped into the fluid and the no. of minutes are noted when the first flocculation occurs in the clear fluid. After 15 min. the reaction may be positive in healthy individuals. The test is positive only when the sedimentation figures are markedly increased. It parallels the sensitiveness of the sedimentation reaction.

H. J. CORPER

Adrenaline blood pressure curves and serum calcium mirror at high altitude. MAX DUGGE. *Beitr. klin. Tuberk.* 65, 96-111(1926).—The adrenaline blood pressure curve is only of value in so far as the part played by the vegetative nervous system upon the circulatory organs is concerned in explaining the climatic action of high altitudes. The results of other tests of the vegetative nervous system are frequently contradictory. The adrenaline curve alone will not permit an exclusive conclusion concerning sympathetic insufficiency since there are cases in which psychogenic irritation can occasion blood pressure and pulse changes, while adrenaline does not act thus. A definite relation between the abs. serum Ca content, and the course of the adrenaline reaction does not exist. A definite adrenaline blood pressure curve occurring within a 2 months' residence at high altitude was not noted, yet in individual cases with low serum Ca content and good reacting power of the vegetative nervous system an increase in the serum Ca occurred. No correlation between the grade of serum Ca increase and the form of tuberculosis existed.

H. J. CORPER

Pock detritus as a protein substance. M. RAKUZIN AND T. GENKE. *J. exper. Biol. Med.* (Russ.), No. 4, 57-64; *Chem. Zentr.* 1926, II, 605.—Glycerol-free pock detritus gives biuret, Millon, xanthoprotein, Adamkewitsch, Ostromuisslenski and Molisch reactions, and yields to 95% EtOH substances which give the Moli ch and the Adamkewitsch reactions. When adsorbed by $\text{Al}(\text{OH})_3$, the aq. soln. of the detritus first loses its positive biuret reaction and then loses its Millon reaction.

C. C. DAVIS

The effect of pregnancy and lactation on the blood calcium of thyroparathyroidect-

tomized dogs. E. LARSON AND N. F. FISHER. *Endocrinology* 11, 233-6(1927).—In 2 cases it was found that the blood Ca of thyroidectomized and partially parathyroid-ectomized dogs was decreased by pregnancy and lactation. These dogs had maintained a normal Ca level previous to pregnancy. H. J. DEUEL, JR.

Case of Bence-Jones proteinuria, with a note on the urinary excretion of mineral elements. R. A. CURRIE. *Glasgow Med. J.* 107, 31-4(1927).—A report of a case in which an increased urinary excretion of Ca and of Mg were noted. This suggests rapid bone destruction which is in line with the frequent assocn. of Bence-Jones proteinuria with myeloma. H. J. DEUEL, JR.

Gastric analysis in cases of diabetes and glucosuria. EVELYN MCPHERSON. *Glasgow Med. J.* 107, 340-50(1927).—Hypochlorhydria is often assocd. with diabetes. H. J. DEUEL, JR.

Variation in the reactions obtained in repeated agglutination tests of the same fowls with *Bacterium pullorum* antigen. J. R. BEACH. *Hilgardia* 2, 529-44(1927).—A positive reaction to the agglutination test may be considered a highly accurate indication of *Bact. pullorum* infection. A negative reaction to a test, however, appears less accurately to indicate freedom from this infection either recently acquired or of long standing. CARL R. FELLERS

The elimination of cloudy reactions by the use of formalin as a preservative for *Bacterium pullorum* antigen. J. R. BEACH AND S. TER-MICHAELIAN. *Hilgardia* 2, 545-53(1927).—Formolized antigen (0.1%) was much more satisfactory than phenolized antigen in preventing cloudiness in 1700 tests. CARL R. FELLERS

The clinical value of the determination of the urea and indican contents of blood serum. MICH. SZOUR. *Deut. med. Wochschr.* 53, 964(1927); cf. *C. A.* 21, 1302.—The Haas and Rosenberg modification of Jolle's method for the detn. of indican is of clinical value. ARTHUR GROLLMAN

State of combination of calcium in the serum. The pathological significance of this state of combination. KARL KLINKE. *Klin. Wochschr.* 6, 791-4(1927).—Ca appears in blood serum in 3 forms: (1) An ionized portion which amounts to about 2 mg.%. (2) A complex or molecular aggregate that is sol. (3) A complex aggregate that is combined with the protein, possibly by adsorption. The serum is never satd. with the Ca ion. The theoretical satn. concn. of the Ca ion is 3 mg.%. MILTON HANKE

Comparative studies on the blood sugar content of arterial and venous blood in normals and in diabetics. G. ROSENOW. *Klin. Wochschr.* 6, 805-6(1927).—The blood sugar content of arterial and of venous blood is identical in diabetics. Arterial blood normally contains more sugar than does venous blood. MILTON HANKE

Serological studies concerning the influence of normal serums on isolated vascular preparation. E. FRIEDBERGER. *Klin. Wochschr.* 6, 1047(1927).—The lower half of the body of rats and guinea pigs was perfused with serums, in various dilns., in such a manner that the drops of liquid coming from the vein could be counted as in the Lawen-Trendelenberg prepn. The animal's own serum, active or inactivated, produces a max. contraction of the vascular system. This poisonous effect can be eliminated by washing out the prepn. with Ringer soln. The action of the serum is entirely reversible. The toxicity of foreign serums in this prepn. parallels their toxicity in the intact animal. Inactivated foreign serum is less toxic than the active serum. Kaolin and tissue cells absorb the toxic substance. Concns. of foreign serums that are too small to contract the blood vessels produce a dilation. Plasma is usually not toxic, a notable exception being eel plasma which is highly toxic even in minute concns. Serum globulin is not toxic. MILTON HANKE

Hypersensitiveness of isolated blood vessel preparations from sensitized and injected animals. E. FRIEDBERGER. *Klin. Wochschr.* 6, 1095-6(1927); cf. preceding abstract.—Isolated blood vessel prepn. from sensitized animals react with dilns. of the homologous serum that is many hundred times below that of the normal reaction range. The contraction of the vessels is instantaneous. The anaphylactic reaction is specific even for a definite fraction of the serum. The contraction continues as long as the serum is perfused through the vessels. The vessels of the sensitized animals are also more reactive to normal serum. The reaction comes on instantaneously; but the vessel tonus decreases as the perfusion continues. An anaphylactic contraction of the vessels is not obtained if the perfusion with homologous serum is conducted after the prepn. has been carefully washed out with Ringer soln. This proves that the hypersensitiveness is not due to something associated with the cells. MILTON HANKE

Potassium and calcium content of whole blood in edema in animals. FRANZ KISCH. *Klin. Wochschr.* 6, 1085-6(1927).—Edema was artificially produced in the

hind legs of animals. The K content of the whole blood in the edematous parts is markedly increased; the Ca content remains unchanged. MILTON HANKE

Glucose equivalent of insulin in diabetes mellitus of children. RICHARD PRIESEL AND RICHARD WAGNER. *Klin. Wochschr.* 6, 1225-7(1927).—The glucose equiv. of insulin in diabetic children depends upon the age of the child, duration of the disease and the body wt. MILTON HANKE

Carbohydrate metabolism of tumors. C. FAHRIG* AND L. WACKER. *Klin. Wochschr.* 6, 1227-8(1927).—Lactic acid production by surviving tissue was studied by the method of Warburg. All of the tissues investigated (myoma, sarcoma, carcinoma, uterus muscle, fascia, epidermis and striated muscle) produce lactic acid when O is present. Normal striated muscle produces more lactic acid than any of the other tissues. All of the tissues, excepting the striated muscle, produce more lactic acid when O is absent. MILTON HANKE

The mechanism of protein therapy. STEFAN RUSZNYÁK AND ANDREAS KORÁNYI. *Klin. Wochschr.* 6, 1332-3(1927).—Animals sensitized to horse serum usually react with fever when they are reinjected with 1 mg. of horse serum. A subsequent injection of 2.5 mg. S again leads to a rise in temp. Novoprotein (0.5 cc.) does not produce fever. In either case a reaction is not obtained upon the reinjection of horse serum. The S and the heterogeneous protein have desensitized the organism so that it is incapable of reacting with the original irritating substance. Injection of a heterogeneous protein may, in a few animals, lead to a fall in temp. and a state of collapse. Such animals are not desensitized; for a subsequent injection of the homologous protein leads again to a rise in body temp. MILTON HANKE

The new modification of the Emanuel mastic reaction as applied to cerebrospinal fluid. G. EMANUEL AND H. ROSENFELD. *Klin. Wochschr.* 6, 1375-8(1927).—The method is described in detail. Good bibliography. MILTON HANKE

Control of the acid-base balance in secretion disturbances of the stomach. LEO HERMANN AND J. M. SAKK. *Klin. Wochschr.* 6, 1367-70(1927).—The alkali reserve varies normally from 53 to 60. Hyperacidity is associated with fasting values that hover around 53. A test meal which elicits an abnormal flow of HCl leads to a marked temporary increase in the alkali reserve value. Isochlorhydria is characterized by a high, fasting alkali reserve value—about 60—and by the fact that the ingestion of food either does not increase this value, or lowers it. The alkali reserve of the blood is influenced by the secretion of HCl into the stomach and by the excretion of alkali into the intestine. The latter factor is, normally, of little consequence because it is so markedly overbalanced by the HCl secretion. Secretion of alkali into the intestine does, however, influence the alkali reserve in cases of isochlorhydria or achylia because in these cases there is little or no secretion of HCl. MILTON HANKE

The nature of allergens. F. KLEWITZ AND R. WIGAND. *Klin. Wochschr.* 6, 1432-3(1927).—Allergens are heat-resistant and not heat-coagulable, not pptd. by cold, satd. $(\text{NH}_4)_2\text{SO}_4$ pptd. by $(\text{NH}_4)_2\text{SO}_4$ in substance, dialyzable, adsorbed irreversibly and quant. by animal charcoal, adsorbed to some extent by kaolin and by $\text{Al}(\text{OH})_3$, sol. in 85% NaCl, insol. in EtOH, Et₂O, CHCl_3 and Me_2CO , and do not give a biuret reaction. MILTON HANKE

Lactic acid content of blood particularly in hepatopathics. G. NOAH. *Klin. Wochschr.* 6, 1465-6(1927).—The lactic acid content of the blood is normal in hepatopathics excepting in very severe cases; in these it is elevated. Venous blood from a large malignant tumor contains more lactic acid than blood from any other part of the body. MILTON HANKE

Rickets. ARNOLD ORGLER. *Klin. Wochschr.* 6, 1501-5(1927).—A review. No bibliography. MILTON HANKE

Influence of the environment temperature on immunity and infection. E. FRIEDBERGER AND S. SEIDENBERG. *Klin. Wochschr.* 6, 1515 6(1927).—Guinea pigs were injected with sheep serum. Some of the animals were kept in warm lab. cages; a second group was placed in similar cages but outdoors (temp. 6°). The food, body temp. and gain in wt. in both groups were the same. After 17 days the animals that were kept warm were hypersensitive to 0.01 cc. of sheep serum. The animals kept in the cold were not sensitive to sheep serum regardless of the dose used. Hypersensitivity does not develop in the latter animals if they are transferred to a warm room for 1 to 2 weeks before reinjection. The elevated metabolism that is necessary to keep the animals warm at low surrounding temps. must lead to a destruction of the antigen in such a way that the body cells do not become sensitive to it. MILTON HANKE

Colloid chemical model of the double-ring phenomenon. R. DOERR AND E. BERGER. *Klin. Wochschr.* 6, 1562-3(1927).—The double-ring phenomenon that is

observable when an antigen soln. is superimposed upon an immune serum soln. can be duplicated by superimposing a 1% soln. of thorium sulfate upon a dil. soln. of normal horse serum or by superimposing the thorium sulfate soln. on a 2% Na_2CO_3 soln. The double ring occurs always in the upper liquid. This can be proved by mixing gelatin with an immune serum and superimposing the antigen on the solid mass. The rings occur in the liquid phase. An explanation is to be given elsewhere. MILTON HANKE

Zone phenomena, double-ring phenomena and their origin. L. REINER AND H. KOPP. *Klin. Wochschr.* 6, 1563(1927).—Friedberger asserts that the two rings formed, when an antigen is superimposed upon an immune serum, are of different compositions, the upper one being lipid in character (cf. *C. A.* 20, 235). That this is not the true explanation is proved by the fact that the double-ring phenomenon is exhibited by substances that are both chemically and immunobiologically pure. The zone phenomenon is a physical manifestation. The clear band between the two ppt. rings represents an area in which concns. of antigen and antibody exist that are favorable to the resolution of the ppt. Theoretically it should be possible to have more than two rings and this can, indeed be accomplished, under suitable exptl. conditions, which are described.

MILTON HANKE

Blood-chemistry studies in leprosy. II. The alkali reserve. E. M. PARAS. *Philippine J. Sci.* 33, 155-67(1927); cf. *C. A.* 20, 3504.—The Van Slyke detn. of CO_2 capacity was performed on 12 specimens of blood plasma from healthy subjects and 110 cases of leprosy. The readings obtained for normal non-lepers range from 60 to 78 vol. %. This variation is about the same as that found by other investigators for normal individuals. Uncomplicated leprosy is not accompanied by any significant change in the alkali reserve. The av. readings showed: (a) In lepra reaction most cases gave normal results; possibly reduction of alkali reserve occurs only in a severe febrile reaction. (b) Characteristic readings of alkalosis were observed in some of the cases with lepra reaction who received alkali treatment. (c) Significant reduction of the alkali reserve was observed in lepers with nephritis and in those with miscellaneous complications. (d) Practically normal results were noted for lepers with tuberculosis. Detn. of alkali reserve in connection with alkali therapy is evidently important in lepra reaction, and is valuable in the study of nephritis among lepers. No correlation can be traced between the alkali reserve and the duration, type and advancement of the leprosy or the antileprosy treatment.

A. L. HENNE

Bacterial invasion of the enamel in dental caries. C. F. BÖDECKER. *Dental Cosmos* 69, 987-1002(1927).—Caries of the enamel is not a simple soln. of the inorg. salts. The active agents are bacteria which penetrate through the body of the enamel rod proper. The acid which is formed penetrates the enamel deeply in all directions.

JOSEPH S. HEPBURN

Basal metabolism in anemias. LEOPOLDO ROSSI. *Arch. patol. clin. med.* 5, 583-91(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 65-6.—No relation was found between basal metabolism and hemoglobin content. In 2 cases of aplastic anemia the basal metabolism was -8.6 to -39.47 and -10.5 to -17.7%. In tuberculous anemia it was increased by 25 to 42.3%, and varied between -13 and 7.5 in secondary hemorrhagic anemia. In pernicious anemia with splenomegaly it was 37 to 46 before splenectomy, and fell to 12.4 to 13.5, -5 to -6 and finally 1 within 2.5 weeks after the operation. The metabolic values above and below normal probably correspond with increased and decreased activities of the hematopoietic system.

MARY JACOBSEN

Toxic effect of tumors and organs of the chicken. A. H. ROFFO AND R. LÓPEZ RAMÍREZ. *Bol. inst. med. exp.* 2, 877-82(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 34.—The blood pressure of dogs is not materially altered by the injection of an ext. of Rous tumor or of the liver of a normal chicken or of one having a Rous tumor, provided the ext. is filtered or heated to 55° with or without centrifuging. The centrifuged ext. of a chicken tumor causes in chickens severe hypotension and death with convulsions. Lung. ext. (of a tumor chicken?) acts similarly. The effect is suppressed by ultrafiltration or heating. Injections of the virus extd. from a chicken sarcoma has no effect on either blood pressure or survival of chickens.

MARY JACOBSEN

The toxicity of tumors in relation to the organs on which they develop. A. H. ROFFO AND E. GARCIA VELLOSO. *Bol. inst. med. exp.* 2, 973-7(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 34-5.—The ext. of lung metastases is more toxic than that of the original tumor. The toxicity of lung ext. is higher than that of liver ext. Whenever there is a consistently higher relative toxicity of both tumor and substrate tissue, the former may be considered as detd. by the substrate rather than by the neoplastic tissue itself.

MARY JACOBSEN

The presence of an insulin-like substance in malignant tumors. A. H. ROFFO

AND L. M. CORREA. *Bol. inst. med. exp.* 2, 969-71(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 34; cf. *C. A.* 21, 2732.—The question is discussed whether the insulinoid of the rat tumor is a reserve substance or a sp. product of the tumor. The occurrence of insulinoids in almost all organs of various animals is in favor of the former, their presence in plants in favor of the latter view.

MARY JACOBSEN

Effect of thyroid on purine metabolism. I. Effect of thyroid feeding and thyroidectomy on the purine metabolism of the dog. R. WAKABAYASHI. *Folia endocrinol. japon.* 2, 17-9, 415-50(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 60.—In a normal bitch thyroid feeding caused after a certain period of time a distinct and progressive rise of total N and an abs. and relative increase of allantoin, uric acid and purine bases. The values gradually returned to normal after thyroid feeding was discontinued. Thyroidectomy had the opposite effect. It was most pronounced after removal of $1/2$ the thyroid. The wt. was unchanged or slightly increased. **II. Purine metabolism of man in disturbances of thyroid function.** *Folia endocrinol. japon.* 2, 20-1, 478-511 (1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 60.—The normal Japanese excretes daily 0.208 g. uric acid N (I) and 0.0174 purine bases N (II), i. e., 1.37 and 0.20% of the total N (III), resp. Hyperthyroidism, especially Grave's disease, is assocd. with an increase in I, II and III. In hypothyroidism II and III are lowered, while I remains normal; all 3 increase on thyroid medication. The ratio I/III remains unchanged, while II/III is slightly increased.

MARY JACOBSEN

The calcium content of human blood and its regulation by the endocrine glands under normal and pathological conditions. CARLOS P. WALDORF. *Prensa med. argentina* 12, 1216-25(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 694-5.—In 26 cases of thyroid disease an increase of basal metabolism was assocd. with hypocalcemia; there was, however, no direct proportionality. Both returned to normal under irradiation or after thyroidectomy. Serum therapy was ineffective. W. agrees with Leicher that unlike I thyreoidin lowers the blood Ca in normal man. **II.** *Ibid* 13, 67-73.—In 4 cases of acromegaly the basal metabolism was distinctly above normal. X-ray therapy lowered the basal metabolism and blood Ca, the latter reaching the values: 7.6, 7.9, 8.5 and 10.26. The hypocalcemia is made responsible for the pronounced hyperexcitability of the vagus. **III.** *Ibid* 13, 102-6.—A discussion chiefly based on literature data of the effect of ovariectomy, menstrual cycle, ovarian feeding and normal and pathol. pregnancy on the blood Ca. **IV.** *Ibid* 140-3.—In man with testicular insufficiency the blood Ca is related to the basal metabolism. Parathyroidectomy in animals is followed by hypocalcemia. Administration of Ca relieves hypocalcemia and tetany. Parathyroid ext. raises the blood Ca only to its normal level. Human tetany is assocd. with frank or latent hypocalcemia.

MARY JACOBSEN

Muscle carbohydrate in adrenalectomized dogs. G. VIALE, SIMON M. NEUSCHLOSZ AND ESTEBAN TURCATTI. *Rev. méd. Rosario* 17, 24-6(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 810.—The muscle glycogen of adrenalectomized dogs is below normal, but never disappears completely. The lactacidogen content shows a decrease of 50% which is attributed to a modification of muscle function or inactivation of an enzyme rather than to carbohydrate deficiency. An analogy between adrenalectomy and insulin poisoning is denied, since serum of adrenalectomized dogs does not cause hypoglycemia and because Audowa and Wagner observed an increase in lactacidogen under large doses of insulin.

MARY JACOBSEN

Chronic tetany. H. J. JOHN. *Ann. Surgery* 85, 410-27(1927).—Parathyroidectomy is due to a disturbance of the mechanism which governs the metabolism of Ca. Parathyroid hormone supplies the essential element for the operation of this mechanism. It causes an alleviation of symptoms and a rise in the Ca. The serum Ca in chronic cases of tetany is not less than 8 mg. per 100 cc., whereas in acute tetany the lowest figure was 4.5 mg.

FRANCES KRASNOW

Post-operative water metabolism and intradermal salt solution test. A preliminary report. K. E. APPEL AND SELLING BRILL. *Ann. Surgery* 85, 502-8(1927).—There is frequently a reduced disappearance time of the intradermal salt soln. in wheal, after operation. This test may be used as a method for detg. the need of the tissues for water.

FRANCES KRASNOW

Behavior of the blood sugar and liver glycogen in rats infected with trypanosomes. P. REGENDANZ AND C. TROFF. *Arch. Schiffs-Tropen Hyg.* 31, 376-85(1927).—The blood sugar is greatly lowered before death. The decrease is not due to the consumption of the sugar by the parasite but to the effect of its toxin on the sugar-producing organs. The same lowering also occurs in the liver glycogen.

FRANCES KRASNOW

Behavior of serum bilirubin in malaria. M. SCHACHSUWALY. *Arch. Schiffs-*

Tropen Hyg. 31, 399-413(1927).—Serum bilirubin is increased in acute malaria but remains normal in latent cases or in cases without fever. FRANCES KRASNOW

The chemistry of the malaria pigment. W. WARAS. *Arch. Schiffs-Tropen Hyg.* 31, 428-31(1927).—The pigment is sol. in ether, acetic acid and alkali. Its empirical formula is $C_{24}H_{182}N_{22}FeO_{82}$. It resembles Fe-contg. melanin. FRANCES KRASNOW

Blood gas-content in certain pathological conditions of gastric secretion. H. S. LURJE. *Arch. Verdauungskrankh.* 41, 30-9(1927).—During hyperacidity the CO_2 content of the blood has either a high normal value or is a little above normal. In hypoacidity a decrease in the CO_2 content is indicated. There seems to be no parallelism between the O_2 content of the blood and the gastric acidity. FRANCES KRASNOW

Determination of the secretion-activity of the liver by chromoscopy. N. W. KUZNETZOV, L. I. KUZNETZOV AND V. N. SUCHOV. *Arch. Verdauungskrankh.* 41, 89-97(1927).—When the liver secretion is normal, indigo carmine is excreted 15 to 45 min. after injection and lasts usually 1.5 to 2 hrs. In catarrhal conditions excretion occurs between 12 min. and 1 hr. and 50 min. The total excretion is between 4 and 13% as compared with the normal 42 to 74%. The same decrease in total excretion and delay in excretion takes place in other liver affections. FRANCES KRASNOW

A rapid method for the diagnosis of plague. F. M. MARRAS. *Indian J. Med. Research* 14, 287-9(1926).—There are prepd. 2 test tubes contg. 2-3 cc. of glucose soln. and 2 test tubes contg. sucrose soln. One drop of agglutinating antiplague serum of a rabbit (dilu. 1 in 80 to 1 in 100) is then added to one of the 2 tubes of glucose and one drop to one of the tubes of sucrose soln. To each of the 4 tubes is added 1 drop of the material to be examd. In the solns. of sugar with homologous specific antiserum, the multiplication of the plague bacilli takes place rapidly within 5 to 7 hrs. At the same time clots and flakes appear which little by little ppt. and the solns. become acid. FRANCES KRASNOW

Epidemic dropsy: its blood picture, general and biochemical. CHARUBRATA RAY. *Indian J. Med. Research* 15, 67-79(1927).—The total N ranged between 1.4 and 2.52 g. per 100 cc. of whole blood, the non-protein N, between 22.4 and 42 mg. per 100 cc. of whole blood, urea between 18 and 30 mg., creatinine between 1.2 and 1.4 mg., uric acid between 2.8 and 5.0 mg., glucose between 95 and 135 mg., chlorides between 490 and 677 mg., calcium between 6.1 and 15 mg. and cholesterol between 89 and 185 mg. per 100 cc. of whole blood. FRANCES KRASNOW

Some observations on cases of anemia among troops in Bombay. P. N. BASU. *Indian J. Med. Research* 15, 107-16(1927).—There is a marked deficiency in free HCl in the gastric juice; the ratio of neutral fat to free fatty acids in the feces is 1:2.9 for the normal and becomes as high as 1:8.8 in the diseases. There is a slight diminution in the blood lipoids. FRANCES KRASNOW

The relation of endemic goiter to the iodine content of soil and drinking water. R. MCCARRISON, C. NEWCOMB, B. VISWANATH AND R. V. NORRIS. *Indian J. Med. Research* 15, 207-46(1927).—Richness of the soil in I does not preclude the presence of thyroid swelling in 27.7% of girls and 11.8% of boys living at an altitude of 6000 ft. and in a place where endemic goiter is conspicuous by its absence in the general population. The investigation has provided no evidence that in Himalayan India the incidence of endemic goiter is in inverse ratio to the I content of the soil. The water supply may contain an appreciable amount of I and yet goiter be endemic. The substitution of a bacteriologically pure for a bacteriologically impure water has caused rapid disappearance of the endemic, although the new water supply contained less I than the old. I-contg. salts or substitutes for the salts appear to have an influence on preventing this type of endemic goiter. FRANCES KRASNOW

The effect of adsorbents upon the potency of tuberculin. M. DORSET, R. R. HENLEY AND H. E. MOSKEY. *J. Am. Vet. Med. Assoc.* 70, 373-7(1927).—The potency of tuberculin produced from synthetic medium is greatly lowered when passed through filters of diatomaceous earth. The active constituents are adsorbed by substances having a negative charge. FRANCES KRASNOW

Trypanosomiasis of camels in the Anglo-Egyptian Sudan: Diagnosis, chemotherapy, immunity. R. H. KNOWLES. *J. Comp. Path. Therap.* 40, 118-43(1927); cf. *C. A.* 21, 3080.—The formol-gel test, although subject to small errors, is a useful, practical method of diagnosis of trypanosomiasis of camels. Naganol employed in a dose of 10 g., in 10% soln. in water and administered intravenously is a specific in the treatment of camels affected with trypanosomiasis due to *T. soudanense*. Treatment of the disease by combining small doses of Naganol and tartar emetic has given good results with considerable saving in cost. FRANCES KRASNOW

The passage of antigens and antibodies through the placenta. L. NATTAN-LARRIER.

G. RAMON AND E. GRASSET. *Ann. inst. Pasteur* 41, 862-7(1927); cf. *C. A.* 21, 1488.—Toxins and anatoxins when used in doses comparable to those occurring under natural conditions do not pass the placenta in exptl. animals. When abnormally high doses of tetanus toxin are used in the guinea pig, a small quantity passes the placenta and affects the fetus. Diphtheria and tetanus antitoxins, on the other hand, pass the placenta readily. Thus passive immunity may be transmitted from mother to offspring.

E. R. LONG

The passage of toxins, anatoxins and antitoxins through the wall of the alimentary canal. Active and passive antitoxic immunity via the alimentary canal in experimental animals. G. RAMON AND E. GRASSET. *Ann. inst. Pasteur* 41, 868-78(1927).—Young animals after ingestion of moderate doses of diphtheria and tetanus anatoxin, and adult animals after ingestion of massive doses of either toxin or anatoxin, acquire a sp. antitoxic immunity. This is a general humoral immunity, appearing in the same manner as that developing after subcutaneous injection, but of higher degree. Passive immunity is likewise conferred by ingestion of antitoxin, preferably in bile dild. with serum, and is also more effective than that developing after subcutaneous injection. E. R. L.

Glucolysis in leucemic blood. H. I. SCHMITZ AND E. C. GLOVER. *J. Biol. Chem.* 74, 761-73(1927).—The rate of glucolysis in blood from 10 normal individuals varied between 15 and 23 mg. per 100 cc. per hr. and an initial concn. of from 60 to 250 mg. per 100 cc. did not affect the rate in normal or leucemic blood. In chronic myelogenous leucemia the rate may be as rapid as 84 mg. per 100 cc. per hr. and tends to run parallel with the no. and immaturity of the white blood cells. In chronic lymphatic leucemia the rate is seldom more rapid than normal except when the lymphocytes are very immature. A marked increase in the rate of glucolysis in myelogenous leucemia is caused by 0.001 N KCN; there is a less definite increase in lymphatic leucemia. KCN has very little effect on the rate in normal blood. Cf. Falcon-Lesses, *C. A.* 21, 2027.

A. P. LOTHROP

The correlation coefficients of the urine with special reference to cancer. C. P. WHITE. *J. Path. Bact.* 28, 211-31(1925).—Urea is correlated chiefly with creatinine, phosphoric acid, and K; creatinine with K, Na, chloride and water; uric acid with phosphate and acidity, and in cancer cases with Ca; sulfate with Mg and K; phosphate with K, Ca and Mg; chloride with Na and K. The chief alk. phosphates are those of Na and Ca, and the chief acid phosphates those of K, Ca and Mg. NH_3 is correlated in cancer cases with strong acids and acidity, and in non-cancer cases with weak acids and alk. Neutral S is correlated in cancer cases with undetd. N, and in non-cancer cases with creatinine, chloride and Na.

JOHN T. MYERS

Non-typical Wassermanns in spinal fluids. MABEL M. MALCOLM. *Public Health J.* 18, 115-7(1927).—Details are given of 8 specimens of spinal fluid which were found to give a positive reaction with an acetone-insol. antigen and a negative reaction with cholesterinized antigen. Such atypical reactions were never obtained with blood serum although many more tests were made than with spinal fluid, the same reagents being employed in each case.

R. E. THOMPSON

Obesity and thinness. Studies on the specific dynamic action in them of protein. F. H. MASON. *Northwest Med.* 26, 143-6(1927).—In 10 cases of the so-called simple obesity the specific dynamic action of protein was decreased. In hypophyseal obesity (5 cases) there was very little specific dynamic action for protein. In 1 case of "constitutional thinness" there was an increased specific dynamic action for protein.

R. C. WILLSON

The distribution of water and cholesterol in the blood in experimental anemia. MEYER BODANSKY AND O. G. DRESSLER. *Quart. J. Exptl. Physiol.* 17, 157-60(1927).—In exptl. anemia produced by phenylhydrazine and acetylphenylhydrazine, the vol. of the av. red corpuscle is increased. This change is associated with a disproportionate increase in the water content of the corpuscle. However, the swelling is accompanied by an increase rather than a decrease in the cholesterol content of the corpuscle.

FRANCES KRASNOW

An improved antigen for the agglutination test in bacillary white diarrhea. W. L. MALLMANN. *J. Am. Vet. Med. Assoc.* 71, 600-6(1927).—A *B. pullorum* antigen contg. 1 cc. N NaOH to 100 cc. of antigen is recommended. This antigen is somewhat more sensitive, eliminates cloudy reactions and does not require birds to be starved for 48 hrs. previous to bleeding.

FRANCES KRASNOW

The recovery process after fatigue of mammalian skeletal muscle in the normal and the diabetic animal. T. H. MILROY. *Quart. J. Exptl. Physiol.* 17, 161-77(1927).—The characteristic changes in fatigue are entrance of water, loss of some phosphate, depletion of the glycogen store, low lactacidogen value and, for stimulated muscle, low

lactic acid percentage. The less fatigued or the more excitable the muscle, the less the loss in glycogen, the higher the lactic acid value, the better the esterification under fluoride and the smaller the increase in the water content. The recovery process is characterized by a reversal of the fatigue changes. In the depancreatized animal the disturbance in glycogen depends on the severity of the diabetic condition. "Recovery" in the diabetic shows practically no improvement in the glycogen storage and only an insignificant increase in esterification.

FRANCES KRASNOW

The amount of blood phenolase in different dermatoses. M. MELCZER. *Dermatol. Wochschr.* **84**, 317-21 (1927).—While the phenolase titer of the serum in a large group of dermatoses was found to be normal when using a method which was perhaps not sufficiently sensitive, in sp. infections, as lupus vulgaris and particularly in cases of syphilis showing decided symptoms, the phenolase titer was markedly decreased. R. C. W.

II—PHARMACOLOGY

A. N. RICHARDS

The influence of insulin on the tolerance for intravenously injected glucose and fructose. G. T. CORI AND C. F. CORI. *Proc. Soc. Exptl. Biol. Med.* **23**, 461-3 (1926).—The intravenous tolerance of male rats after a 48-hr. fast was approx. 2.5 g. of glucose per kg. per hr.; large doses of insulin raised the tolerance to 3.0 g. The tolerance for fructose when infused into the femoral vein was approx. 0.35 g., and 0.6 to 0.8 g. when infused into a mesenteric vein. Insulin had no effect on the intravenous tolerance for fructose. C. V. B.

Electrocardiographic studies of the action of propylene and some other anesthetic gases. A. M. CAINE AND C. REYNOLDS. *Proc. Soc. Exptl. Biol. Med.* **23**, 488 (1926).—Propylene in concns. of 25 to 50% caused ectopic (originating at various points in each ventricle) beats in the dog and cat. Ectopic beats promptly ceased when the concn. was lowered. This phenomenon did not occur with ether, chloroform, N₂O, ethylene, or acetylene. C. V. B.

The fate of xylose in the animal body. R. C. CORLEY. *Proc. Soc. Exptl. Biol. Med.* **23**, 491-2 (1926).—The fermentable and non-fermentable reducing substances in rabbit blood were detd. before and at hourly intervals following the intravenous injection of 1 g. of xylose; the results were expressed as glucose by the Shaffer-Hartmann method. In general the total blood sugar paralleled the unfermented fraction. Following xylose the reducing power of the blood after fermentation returned to normal in 4 hrs. in controls, in 2 hrs. in phlorhizin diabetes, in 4 hrs. in chloroform poisoning, and had not reached normal in 8 hrs. in tartrate nephritis. The injection of glucose caused no change in the unfermentable sugar. C. V. B.

The effect of insulin on the rate of disappearance of reducing substances in toad blood at different temperatures after injection of glucose. J. M. D. OLMSTEAD. *Am. J. Physiol.* **76**, 200 (1926).—Toads injected with insulin show convulsions in about 36 hrs. at 18°, 24 hrs. at 25° and 18 hrs. at 30°. At 18° the reducing power of the blood increases to a max. of 0.3 mg. % 12 hrs. after injection of glucose. These and other results given may be explained on the assumption that insulin reacts on substances in the body to produce an intermediate substance which acts on the reducing substances in the blood and is responsible for convulsions. J. B. BROWN

A preliminary note on the blood picture in dogs following experimental atrophic gastritis induced by sodium fluoride. C. D. LEAKE AND G. RITCHIE. *Am. J. Physiol.* **76**, 234 (1926).—Repeated administration of NaF once or twice weekly to dogs over a period of ten weeks resulted in a reduction of the gastric acidity to 0 with a final decline of erythrocyte count of 2 million. The histological changes found were slight atrophic gastritis, moderate extension of red bone marrow and an abnormal deposition of the Fe pigment in the spleen and red bone marrow. J. B. BROWN

The action of adrenaline and ergotamine on the uterus of the rabbit. J. H. GADNUM. *J. Physiol.* **61**, 141-50 (1926).—The effect of adrenaline and ergotamine on the rabbit uterus has been detd. Ergotamine tends to increase the concn. of adrenaline necessary to produce a given contraction. J. B. BROWN

Investigation on the tensile strength of strips of haddock muscle before and after various treatments. J. C. FORBES. *Trans. Roy. Soc. Can.* **20**, Sect. V, 145-53 (1927).—Marked increase in tensile strength was caused by weak alk. (p_H 8-10), by treatment with NaCl, especially acidified concd. NaCl, and by HCHO. Acidity (p_H 1-2) had a pronounced disintegrating effect on the tissue and a pronounced dehydrating effect. Fresh muscle showed a marked decrease in tensile strength when heated to 33° for 30 min. Brining, drying, and especially HCHO increased resistance to heat. A. T. CAMERON

The relaxation of histamine contractions in smooth muscle by certain aldehydes. A. I. KENDALL. *J. Infectious Diseases* 40, 689-97(1927).—K. demonstrates by kymograph tracings the relaxation, by certain aldehydes, of contractions induced in guinea-pig gut and uterus by histamine and certain histamine-like substances. The absence of O on the C atom next the CHO group appears to predispose the aldehyde mol. as a whole toward reactivity whereas the presence of O in this position restrains or prevents the reactivity of the aldehyde radical. The method is of value in the detection of histamine and histamine-like substances.

The effects of formaldehyde on smooth muscle contraction in anaphylaxis. A. I. KENDALL, H. L. ALEXANDER AND JANET A. HOLMES. *J. Infectious Diseases* 41, 137-42 (1927).—HCHO, in suitable, small concns., prevents a sensitized smooth muscle from contracting on contact with its homologous antigen, relaxes anaphylactic contractions induced in sensitized smooth muscle and apparently desensitizes smooth muscle.

The seat of action of veratrine. G. RUSSO. *Arch. sci. biol. (Italy)* 9, 78-87(1926).—Veratrine acts directly upon the muscle.

Comparison of the pharmacological actions of cuprous and cupric salts. G. SPAGNOL. *Arch. sci. biol. (Italy)* 9, 132-45(1926).—Large intravenous dosages of Cu^+ and Cu^{++} salts (CuCl and CuSO_4) in rabbits indicate that for heavy doses, *i. e.*, 0.00027-0.0009 g. mol. Cu/kg. of body weight, both salts are equally toxic. In medium doses, 0.00027-0.00005 g. mol., the Cu^{++} is fatal in 3 hrs., Cu^+ in 15 hrs. The slower action of the cuprous salt may be due to the time required for its oxidation in the body. In slow poisonings the 2 salts become identical in their toxic action.

Influence of osmotic pressure on the absorption of medicinal solutions across the cornea. R. GALLENGA. *Arch. sci. biol. (Italy)* 9, 212-23(1926).

Curari hyperglucemia and insulin. ACHILLE RONCATO. *Arch. sci. biol. (Italy)* 9, 291-304(1927).—Hyperglucemia induced by curari is not overcome by insulin. Hypo-glucemia from insulin is overcome and even changed to hyperglucemia by curari. There is, therefore, a non-reciprocal antagonism between the 2 drugs.

The pharmacological action of magnesium on the neuro-muscular preparation. A. JAFELLI. *Arch. sci. biol. (Italy)* 9, 418-34(1927).

The glucose in blood after intravenous injection of sea water. A. RABBENO. *Biochim. terap. sper.* 14, 171-8(1927).—No change in glucose content results in rabbit blood after intravenous injection of sea water. NaCl or CaCl_2 alone produces glucosuria and also hyperglucemia, while Mg salts induce glucosuria. Therefore, the salts in sea water must be present in physiol. equil.

The so-called "vagus hormone" of Loewi. New experiments on conjugated hearts of dogs. L. PATRIZI. *Boll. soc. ital. biol. sper.* 2, 117-22(1927).—Adrenaline, atropine and especially neurine and pilocarpine have an exciting action upon the heart similar to that of the cardiac nerve. When 2 dogs have a vein of one joined to an artery in the other, then an injection of one of the above drugs into the heart of one dog will affect the heart of the other dog in exactly the same way.

Non-specific irritation therapy in pulmonary tuberculosis. GUSTAV MAURER. *Beitr. klin. Tuberk.* 64, 433-48(1926).

The role of camphor in the treatment of pulmonary tuberculosis. F. L. v. MURALT AND P. WEILLER. *Z. Tuberk.* 46, 341-6(1926).—Favorable results are recorded from the use of camphor in the treatment of 430 cases of pulmonary tuberculosis.

The pharmacological action and behavior in the organism of the two phenylmethylisoxazolecarboxylic acids and other substances containing the oxazole and isoxazole group. MARIA DONINI. *Arch. farmacol. sper.* 43, 51-87(1927).—The 2 isomeric phenylmethylisoxazolecarboxylic acids prepd. by Betti (*C. A.* 10, 600) show considerable difference in pharmacol. behavior. The acid m. 157° is toxic in large doses and produces progressive paralysis. The lethal dose is 5 g. per kg. for frogs and 3 g. per kg. for rats. The isomeric acid, m. 189°, is inert. Of the intermediate products obtained in the synthesis of these acids the most toxic is the amide, which in large doses has a strychnine-like effect with direct action on the spinal medulla. Benzalmethylisoxazolone, from which the amide was prepd., is less toxic. The oxazole group itself appears to be devoid of toxicity, since methylloxazole is inert. Substitution of a Ph group increases the toxicity, phenylmethylloxazole being much more active than dimethylloxazole. The acid m. 157° is excreted for the most part unaltered in the urine, whereas the corresponding amide is entirely broken down. Neither BzOH nor PhOH could be detected.

Pharmacological action of iron in double and complex salts. L. SABBATANI.

Mem. accad. Lincei [6], 1, 20 pp.; *Chem. Zentr.* 1926, I, 3490; cf. *C. A.* 21, 1847.—Mixts. of FeSO_4 and $\text{Fe}_2(\text{SO}_4)_3$ solns. with Na oxalate, citrate and tartrate solns. were investigated. Between the Fe salts on the one hand and the Na org. salts on the other there was mutual antagonism. The poisonous action of the org. salts is only slightly reduced by the Fe salts (the action of the tartrate being most affected), the org. salts influencing FeSO_4 only slightly, and $\text{Fe}_2(\text{SO}_4)_3$ very powerfully. If the org. salts are injected before the Fe salts, they weaken the action of the latter far less than they do when injected simultaneously with the Fe salts. The formation of new complex ions, which begins at a certain concn. of the org. salt, shows itself as a break in the curve of the action of the various mixts. Ferric salts have a powerful, immediate, poisonous action, but because of their rapid conversion into colloidal $\text{Fe}(\text{OH})_3$, which has only a feeble local action, they have little or no after-effect. The influence of the org. salts is therefore of most importance in connection with their min. lethal dose, and is of relatively little significance in symptomatology. The converse is true of ferrous salts, which have a weak immediate effect, but a powerful after-effect. Pure FeSO_4 causes diarrhea, hemoglobinemia, hemoglobinuria, depression, paralysis and general thrombosis, but in conjunction with citrate or tartrate only depression and paralysis, the blood remaining fluid and coagulating with difficulty or not at all. C. C. DAVIS

The problem of the poisonousness of colloidal silver (so-called collargol injury). J. VOIGT. *Z. ges. expl. Med.* 52, 33-40; *Chem. Zentr.* 1926, II, 2456.—A rabbit weighing 2 kg. died after injection of 1 cc. of 12% collargol in 9 cc. of a 0.1% Na protalbinat soln.; this is 0.097 g. of Ag, a quantity which under different conditions would be readily tolerated. Anatomical-microscopical examn. showed an extraordinarily high soly. of the metal. It is believed that there is an unfavorable mutual influence of the different protective colloids, which results in an abnormally high soly. of the Ag. Combinations of colloidal substances for therapeutic use necessitate detailed animal experimentation. C. C. DAVIS

Investigations of coramine and cardiazole. LEON ASHER. *Z. ges. expl. Med.* 52, 197-213; *Chem. Zentr.* 1926, II, 2456.—Coramine is superior to cardiazole in circulatory or respiratory complications. Even at low concns., cardiazole caused convulsions in rabbits and even in 2% soln. in many cases caused their death, when the rabbits were not deeply narcotized. On the other hand coramine was tolerated in 10% soln. and by deeply narcotized rabbits in 20 and 50% solns. The favorable action continued for a prolonged period. Even without interruption of the narcosis, respiration was improved by coramine, in contrast to cardiazole, and so it is an agent of great practical importance. C. C. DAVIS

The action of thyroxin on gas exchange in the rat. W. ARNOLDI. *Z. ges. expl. Med.* 52, 249-59; *Chem. Zentr.* 1926, II, 2610. C. C. DAVIS

The action of synthalin in the animal organism. P. H. SIMOLA. *Z. physiol. Chem.* 168, 274-93(1927).—Synthalin, a guanidine deriv. recently introduced as an insulin substitute for the treatment of diabetes, was administered to sheep and rabbits and its action compared to that of insulin. According to Virtanen and Karström (*C. A.* 21, 771) the decrease in blood sugar brought about by insulin is accompanied by a decrease in inorg. phosphate and an increase in lactic acid. Increased phosphorylation appears to be a characteristic of insulin action. The lowering of blood sugar by synthalin, on the other hand, may or may not be accompanied by a decrease in inorg. phosphate, and where hyperglucemia results there is a great increase in phosphate. An increase in lactic acid occurs, however, as in insulin. Synthalin, even in lethal doses, did not cause any remarkable lowering of blood sugar and in some of the expts. a marked hyperglucemia was observed. The substance is unmistakably toxic and convulsions may occur with relatively high blood sugar. Injection of sugar does not stop these convulsions or prevent the animal's death. The symptoms in general resemble ordinary guanidine poisoning. The animals become uneasy, breathing is labored and defecation frequent. After 3-5 hrs., they become apathetic and the respiration slower and stridorous. There is a copious nasal secretion and a twitching of the muscles. Death occurs with increased dyspnea and asthenia. In the lightest cases the animals recovered after 8-12 hrs. but remained for days without appetite. Post-mortem examn. showed fatty degeneration of the liver and nephrotic changes in the kidney. The lethal dose for sheep was 2.6-2.8 mg. and for rabbits 3.5-4.5 mg. per kg. subcutaneously. A. W. DOR

The action of ultra-violet light, thyroid and parathyroid substances upon an artificial plasma in vitro. H. C. W. VINES. *Endocrinology* 11, 125-35(1927).—A study of the variation in Ca in an aq. soln. (0.6% NaCl, 0.2% NaHCO_3 , 0.1% glucose, dried egg albumin, cholesterol, cholesterol oleate at p_H of 7.4) in the presence of excess solid $\text{Ca}_3(\text{PO}_4)_2$. Parathyroid ext. increases Ca, making the soln. more alk. Increase in

acidity decreases Ca. There is a slight const. increase in Ca after exposure to ultra-violet light. Thyroid ext. increases acidity and also Ca but the former effect is prevented by ultra-violet light. Cholesterol fats in soln. affect the increased Ca caused by ultra-violet light and parathyroid ext. while they are not responsible in the thyroid ext.

H. J. DEUEL, JR.

A criminal case of fatal sub-acute thallium poisoning. L. KAPS. *Wiener klin. Wochschr.* 40, 967-70(1927).—The early symptoms of vomiting, colic and diarrhea were followed by obstinate constipation and anorexia. There were widespread disturbances in the nervous system and degeneration of heart, liver and kidneys. D. B. DILL

The theory of the action of synthalin. H. K. BARRENSCHEEN AND ALFRED EISLER. *Wiener klin. Wochschr.* 40, 1074-5(1927); cf. *C. A.* 21, 3231.—The effect of synthalin on inorg. phosphate and on urinary phosphate excretion is similar to that of insulin.

D. B. DILL

The toxic secondary effects of synthalin. EDUARD SZCZEKLIK. *Wiener klin. Wochschr.* 40, 1075 6(1927).—Dyspepsia and liver damage sometimes follow the partial or complete substitution of synthalin for insulin.

D. B. DILL

The behavior of isoquinoline in the animal organism. MASAO TAKAHASHI. *Z. physiol. Chem.* 169, 297-9(1927).—After injection of 40 g. isoquinoline in dogs, in daily doses of 0.1-0.3 g. as a 10% soln. in olive oil, 1.59 g. of the $PtCl_4$ salt of methylisoquinoline was isolated from the urine. From 15 g. injected in chickens the recovery of the $PtCl_4$ salt of the Me deriv. was 0.5 g. Similar expts. with rabbits were negative. Like pyridine and quinoline, isoquinoline is thus partly methylated in the organism.

A. W. DOX

Intoxication from a thallium preparation. H. LUBRIG. *Pharm. Zentralh.* 68, 561-2(1927).—A case is cited descriptive of all the phenomena following the ingestion by a 2½-year old child of bread smeared with a rat poison contg. Tl and ending fatally.

W. O. E.

The action of photosensitive substances in the isolated frog heart. H. WASTL. *Arch. expl. Path. Pharmacol.* 114, 56-69(1926); *Physiol. Abstracts*, 11, 535.—Hemato-porphyrin and eosin have a more deleterious effect on an isolated frog heart if the heart is irradiated with the light from a half-watt lamp than if it is not. Horse serum delays the onset of this effect.

H. G.

Action of eosin on the central nervous system. A. CLEMENTI. *Arch. fisiol.* 24, 322 42(1926); *Physiol. Abstracts* 12, 61.—The injection of aq. solns. of eosin into the dorsal lymph sac of the frog causes first a slight and transient increase in the reflex excitability; this is followed by a depression, which is assocd. with clonic spasms of the hind limbs and ends in paralysis. If the frogs are exhibited to light, these symptoms appear sooner and are more severe. The direct application of 2 to 4% aq. solns. of eosin on the motor-sensory area of the cerebral cortex of the dog either causes a slight decrease in its faradic excitability or has no effect; in either case this action is not influenced by exposure to light.

H. G.

Hypertonic action of adrenaline following various routes of introduction. P. CLERMONT AND L. GAROT. *Arch. intern. physiol.* 26, 362-88(1926); *Physiol. Abstracts* 12, 52.—The reaction obtained in dogs depends directly on the rate of absorption. Subcutaneous injection produces no effect on blood pressure, but a moderate slowing of the pulse and increase of the respiratory waves on the tracing. Intramuscular injection causes a slight increase of pressure, especially if previously low; the pulse is slowed. If introduced directly into the stomach or intestine there is usually a slight fall of blood pressure, but the effects vary; the adrenaline administered is inactivated by the liver. Rectal administration produces bradycardia, with increased amplitude, but an inconstant hypertonic effect. Intra-arterial injection causes the same results as intravenous administration, but much less marked.

H. G.

Action of selenium compounds on cultures of normal and malignant tissues. A. H. ROFFO. *Bol. inst. med. expl. Buenos Aires* 1, 847-67(1925); *Physiol. Abstracts* 12, 4.—K selenate only allows the growth of chick embryo heart in a diln. of 1 in 10,000 but a sarcoma of a rat only grows in a diln. of 1 in 70,000. If Rb selenate is used, growth of the rat sarcoma only occurs in dilns. of more than 1 in 100,000.

H. G.

The Indian kidney-tea, Koemis Koetjing. A. GRUBER. *Deut. med. Wochschr.* 53, 1299-1301(1927).—A non-toxic ext. of the leaves of Koemis Koetjing, contg. the glucoside *orthosiphonin* and many K salts, is valuable in renal conditions because of its diuretic action.

ARTHUR GROLLMAN

A case of metacetaldehyde poisoning. W. H. WILLCOX AND C. AINSWORTH MITCHELL. *Analyst* 52, 528(1927).—A boy of 16 swallowed by mistake about 5 g. of solid fuel used as a substitute for CH_3OH . The metacetaldehyde content caused very

serious poisoning. It is remarkable that the metacetaldehyde should prove so much more active than the isomeric paraldehyde. W T. H.

The appearance of quinine-resistant lipases in the serum after arsphenamine. W. B. MEYER AND FRANZ BUSCHKE. *Klin. Wochschr.* 6, 987-90(1927).—Injection of arsphenamine into normal individuals does not lead to the appearance of quinine-resistant lipases in the serum. MILTON HANKE

Hormones and narcotics. H. ZONDEK AND H. W. BANSI. *Klin. Wochschr.* 6, 1319-21(1927).—Natural sleep is associated with a decreased concn. of hormones in the limiting surfaces of the cells. Narcotics produce changes in the cell membranes such that hormones are absorbed in decreased amount. MILTON HANKE

Influence on the progeny of thallium poisoning in the mother. K. EHRLHARDT. *Klin. Wochschr.* 6, 1374-5(1927).—Lactating rats, that are receiving a fatal dose of Tl, secrete some of the Tl into the milk. The quantity so secreted is sufficient markedly to inhibit the growth and development of the young and to produce a temporary alopecia, but not sufficient to be fatal. MILTON HANKE

Contractility of the gall bladder. H. ERBSEN AND E. DAMM. *Klin. Wochschr.* 6, 1382(1927).—The surviving gall bladder, not distended, contracts when pilocarpine, histamine, KCl or BaCl₂ is added to the suspension fluid. Atropine, adrenaline, CaCl₂, MgCl₂, hypophysin and pituitrin have an anesthetic effect. The distended gall bladder exhibits some spontaneous contraction. Hypophysin and pituitrin, that have an anesthetic action on the placid gall bladder, produce contractions in the distended gall bladder. MILTON HANKE

Chemotherapy of mouse carcinoma by means of ferment poisons (potassium cyanide). L. KARZAG. *Klin. Wochschr.* 6, 1382-3(1927).—Mice can be made to tolerate fairly large doses of KCN without symptoms. Tumor cells are very susceptible and they do not acquire a tolerance for KCN. The results obtained on carcinomatous mice indicate that KCN is of some value as a preventive and as a curative agent. MILTON HANKE

Uric acid metabolism and insulin. L. KURTI AND G. GYORGYI. *Klin. Wochschr.* 6, 1426-8(1927).—Administration of insulin to normal individuals leads to a retention of uric acid. MILTON HANKE

Action of hydrogenated imidazoles on the blood sugar. FELIX HAUROWITZ AND MAXIMILIAN REISS. *Klin. Wochschr.* 6, 1479(1927).—2,4-Diketodihydroimidazole, 2-iminotetrahydroimidazole and 2-imino-4-ketodihydroimidazole have no action on blood sugar. MILTON HANKE

Chronic mercury poisoning and the danger associated with amalgam. H. FÜHNER. *Klin. Wochschr.* 6, 1545-8(1927).—A bibliographical review. Chronic Hg poisoning has never been noted when the daily excretion of Hg into the urine is only a few hundredths of a mg. A daily excretion of several tenths of a mg. is associated with symptoms of poisoning. Ag amalgam fillings seldom lead to Hg poisoning. Poisoning from this source must be due either to Hg vapor or to soln. of Hg from the amalgam by the saliva. Cu amalgam is unstable and should not be used as a filling material. M. H.

Influence of calcium on the action of the sympathetic on frog's heart. J. TEN CATE. *Arch. néerland. physiol.* 10, 498-509(1926); *Physiol. Abstracts* 11, 534-5.—The heart (*Rana temporaria*) was perfused *in situ*. Perfusion of a Ringer soln. without Ca arrests the heart and abolishes the response to sympathetic stimulation; replacing the Ca leads to increased frequency and amplitude of the beats and enhancement of the sympathetic effect. CaCl₂ can be replaced by equiv. amts. of SrCl₂ or BaCl₂, but the latter is less effective; MgCl₂, CoCl₂ and MnCl₂ are without action; if a Ringer contg. MgCl₂, etc., instead of CaCl₂, is perfused without the previous production of arrest of activity from lack of Ca, the beats finally cease, and the effect of sympathetic stimulation is directly proportional to the activity of the heart at the moment. At the commencement of the period of perfusion with a Ringer without Ca, the effect of sympathetic stimulation is augmented. The disappearance of the sympathetic effect in the absence of Ca is due chiefly to alteration in the contractile power of the heart itself, since the excitability of the nerve falls much more slowly than the contractility of the heart; moreover, direct stimulation is without effect, contrary to what occurs with lack of K. E. H.

Action of sympathetic and vagus on frog heart. J. TEN CATE. *Arch. néerland. physiol.* 10, 544-62(1926); *Physiol. Abstracts* 11, 535.—The automatism of the heart depends on K, the contractility on Ca. If the heart is perfused with a Ringer soln. contg. only 0.1 the normal amount of Ca, it can be shown that the effect of sympathetic stimulation on the rate of beat is still definite when its effect on the amplitude is almost abolished, and an arrested heart can be made to beat again; hence sympathetic stimulation must release Ca and make it available for the contractile process. When the heart

is stopped by perfusion of a Ringer soln. lacking in K, sympathetic stimulation arouses a slow beat of normal or supranormal amplitude, presumably by making K available for the automatic centers. The effects of vagal stimulation were studied in the hearts of *Rana esculenta*. Since Ringer soln. lacking Ca or K abolishes vagal excitability, either one contg. excess of Ca was used, when vagal stimulation only slowed the heart, without reducing the amplitude of the beats (the slowing might be greater than under normal conditions), or one contg. excess of K was perfused, when stimulation of the vagus reduced the amplitude, but did not slow the beats. These results are related to the action of K on automaticity and to that of Ca on contractility; thus K is lost to the heart under vagal stimulation, appearing in the perfusion fluid. Hence sympathetic stimulation brings K and Ca to their resp. centers of activity, while vagal stimulation removes them.

E. H.

The effect of narcosis on the labor pains of the puerperal uterus. H. FRANKEN AND H. SCHLOSSMANN. *Arch. Gynäkol.* 130, 215-20(1927).—CHCl₃ causes marked decrease in labor pains. Ether narcosis causes a less decrease while Narcysten narcosis causes an increase in activity of the labor pains.

HARRIET F. HOLMES

Blood changes in acute experimental lead poisoning. K. FUJITA. *Acta Dermatol.* 9, 48-57(1927); *Ber. ges. Physiol. expll. Pharmacol.* 40, 597.—Addn. of Pb(OAc)₂ to the diet caused in rabbits a distinct decrease of the red and an increase of the white count, and a gradual reduction of fibrinogen and hemoglobin. The resistance of the red cells to hypotonic NaCl was not materially altered.

MARY JACOBSEN

The initial hyperglucemic effect of insulin. M. GUARDABASSI. *Ann. fac. med. chir. (Perugia)* 29, 147-77(1927); *Ber. ges. Physiol. expll. Pharmacol.* 41, 86-7.—A transient hyperglucemia is caused by subcutaneous, and more distinctly by intraperitoneal, insulin injections. It is absent or very slight in thyroidectomized animals, while thyroid feeding exacerbates both hyper- and hypo-glucemia and the toxic effect. Adrenal disease or adrenalectomy has no effect. The hyperglucemia is pronounced in diabetics and absent in castrated animals, although the latter are highly sensitive to insulin. The data are followed by a lengthy discussion on the influence of the various hormones through the medium of the liver.

MARY JACOBSEN

Blood sugar. Comparison of blood sugar curves following ingestion and intravenous injection of glucose. WM. G. LENNOX AND MARGARET BELLINGER. *Arch. Internal Med.* 40, 182-94(1927).—In 100 non-diabetic subjects the curves obtained by the two methods showed a normal degree of correlation in 75% cases, and on repeated detn. on 22 subjects in 87% cases. Glucosuria after injections was more frequent and pronounced and bore little relation to the blood sugar. The relative merits of the 2 methods are discussed.

MARY JACOBSEN

Hypoglucemia and the toxic effect of insulin. G. A. HARROP. *Arch. Internal Med.* 40, 216-25(1927).—The clinical picture of insulin overdosage in man may considerably differ from that usually anticipated. Subjective and prodromal symptoms generally may be slight or entirely missing. Glucose administration to unconscious patients does not always bring prompt relief. In 2 cases the symptoms resembled CO poisoning except for the blood coloring. There is apparently no direct proportion between the degree of poisoning and hypoglucemia, which suggests that an additional toxic action is involved.

MARY JACOBSEN

Physicochemical changes in serum caused by rubidium. A. H. ROFFO AND H. DEGIORGI. *Bol. inst. med. exp.* 2, 955-67(1926); *Ber. ges. Physiol. expll. Pharmacol.* 40, 846.—The intravenous injection of RbCl₂ and RbSeC₄ causes in man and animals a slight decrease of p_H , which depends on the dose and, although less pronounced in man, continues even when the injections are kept up for a certain period of time. The surface tension of the blood is also diminished by RbCl₂ and K₂SeO₄, in some cases by 5 dynes. These changes which are caused by well-tolerated doses indicate a disturbance of the colloidal equil. of the serum affecting the imperviousness of the cell membranes. M. J.

Pharmacological study of solarson. I. Toxicity. P. TESTONI. *Clin. med. ital.* 57, 383-92(1926); *Ber. ges. Physiol. expll. Pharmacol.* 40, 739-40.—An intravenous injection of 0.2 g./kg. kills rabbits in 2.5 hrs., 0.1 g. in 2 days (tonic convulsions). Albuminuria appears already in the 1st 24 hrs. One g./kg. subcutaneously kills in 2 hrs., 0.2 g. in 23 hrs. M.L.D.: 0.025 g. was survived; 0.038 was lethal. II. Anatomical and pathological changes in the organs of animals which died from acute or subacute solarson poisoning. *Ibid* 428-36.—Liver and kidney show the typical As degeneration; the former is less pronounced than in cacodylate and aspirochyl poisoning. III. Effect on blood. *Ibid* 457-65.—The red cell no. and hemoglobin content are raised, the white count is reduced by 0.017 g./kg. Larger doses injure the red cells. IV. Behavior of solarson in the animal body. *Ibid* 466-72.—The excretion is more rapid and com-

plete after subcutaneous than after intravenous injection: 48.5-59.8% against 34-47%.

MARY JACOBSEN

Effect of thyroid substance, adrenaline and insulin on the lactacidogen content of muscle and the phosphoric acid of organs. Y. TERADA. *Folia endocrinol. japon.* 2, 13-15, 302-31(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 809.—The lactacidogen content of the femoral quadriceps of the rabbit, normally 0.28%, is reduced $\frac{1}{2}$ -1 hr. after the injection of 0.15 cc. (0.1%) adrenaline (I) or by feeding 0.8 g. thyroid substance (II) (distributed over 2 weeks). Thyroidectomy (III) causes both an increase and decrease (50:50), insulin (IV) a 33% increase. This antagonism also comes into effect when the drugs are combined. The total P of the blood, heart and kidneys is increased; that of the liver lowered by I to IV. Muscle P is markedly raised by IV and diminished by I to III. Simultaneous injection of I, II and III shows no consistent effect on the P of organs, while the antagonism is apparent in the effect on muscle P. M. J.

Effect of insulin on the platelet count and the relation between insulin and thyroid hormone. Y. IWAI. *Folia endocrinol. japon.* 2, 19-20, 451-77(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 809-10.—Single or repeated doses of insulin decrease the platelet count in man and rabbit. Thyroid feeding hastens the return to normal. Thyroidectomy tends to lower the platelet no. The return to normal is slower than with insulin. The thrombocyte no. reaches a max. 1.5 to 2.5 hrs. after injection of thyroid ext. Conclusion: insulin and thyroid ext. are antagonists.

MARY JACOBSEN

Effect of insulin on the contraction of isolated smooth muscle. Z. KUROZONO. *Folia endocrinol. japon.* 2, 43-4, 221-33(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 143.—The inhibiting effect of com. insulin on uterus and heart as formerly reported by K. cannot be attributed to insulin, since it is also produced by heat-inactivated insulin, by the tricesol used for preservation and by dil. acids of the same p_H as the insulin solns.

MARY JACOBSEN

The action of insulin on the lipoids of blood. IWAKICHI OKU. *Folia endocrinol. japon.* 2, 279-301(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 801.—The lipemia caused by olive oil, lard and cod-liver oil (decreasing in the above order) is attributable chiefly to the fatty acids. Lecithin ranges next, while cholesterol has no const. effect. Alimentary lipemia is suppressed by insulin although to a lesser extent than in hunger.

MARY JACOBSEN

Effect of carbon monoxide and potassium cyanide poisoning on the function of the thyroid. S. IGURA. *Folia endocrinol. japon.* 2, 22, 523-44(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 100.—Daily small doses of CO cause degeneration and atrophy of the thyroid in rats. Thyroid feeding hastens death from CO considerably; thyroidectomy delays it insignificantly. Small daily doses of KCN cause thyroid hypofunction. Thyroidectomized rats survive the controls by $\frac{1}{2}$ the time.

MARY JACOBSEN

Pharmacological action of β -indoethylamine. SEIICHI HASGAWA. *Folia pharmacol. japon.* 4, 12-4, 216-32(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 141.— β -Indoethylamine increases the amplitude of the amphibian heart. Large doses have a tonic and vasoconstrictor effect. The pupil dilator is markedly excited. Intravenous injections, esp. large doses, lower the blood pressure after an initial increase. There is also a central vasoconstrictor effect. Small doses change the rhythm and increase the amplitude of intestinal contractions; large ones have an inhibitory effect. Isolated uterine and bladder muscle are stimulated.

MARY JACOBSEN

Pharmacological studies on aorta strips of the rabbit. NOBUHARU KITAMURA. *Folia pharmacol. japon.* 4, 76-8(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 144.—In expts. according to O. B. Meyer contractions were caused by adrenaline, physostigmine, digitalin, arsenite and Ba, relaxation by strychnine, cocaine, pilocarpine, atropine and quinine. Caffeine, chloral hydrate and nicotine had no effect. M. J.

Experimental studies of intravenous infusion of Ringer-Locke solution containing soluble starch. SEIJI HORI. *Folia pharmacol. japon.* 4, 101-13(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 845.—The lethal dose of infusate and the quantity of urine excreted decrease with the starch concn. There is a transient rise in blood pressure, which is reduced by the exsanguination. Autopsy reveals pulmonary edema and diastolic standstill of the heart.

MARY JACOBSEN

Experimental studies on the subcutaneous infusion of hyper- and hypotonic salt solutions. SUSUMU UYEDA. *Folia pharmacol. japon.* 4, 114-22(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 845.—The lethal dose of infusate is const. for concns. from 0.4 to 4%, and considerably smaller for 5% NaCl and for water. The max. amt. of urine is excreted at 1.5% NaCl. Very low concns. cause hemoglobinuria. Blood pressure and respiration are increased by low and diminished by high concns.

MARY JACOBSEN

Methemoglobin formation. I. The effect of certain gases, acids and alkalies on

the production of methemoglobin by chemicals. CHIKARA SUZUKI. *Folia pharmacol. japon.* 4, 156-79(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 459-60.—The methemoglobin production by KClO_3 , pyrogallol, $\text{NH}_3\text{O.HClO}_3$, KNO_3 and aniline-HCl in fresh rabbit blood *in vitro* is promoted by CO_2 and acids, regardless of the reaction of the agents applied. It is inhibited by alkali, while the effect of O_2 varies. The methemoglobin formation and the effect of CO_2 , acids and alkali on it are more pronounced in blood hemolyzed by water, except for pyrogallol for which the opposite obtains. II. Methemoglobin production by chemicals *in vivo* and the effect of gases, acids and alkalies thereon. *Ibid* 180-94.—The effect of acids and alkalies *in vivo* (mice) is less pronounced than *in vitro*, probably because of the buffer action of the blood. Methemoglobin formation is only slightly promoted by acids. It is inhibited by alkalies. The effect of KClO_3 and KNO_3 is not influenced by CO_2 or acid. MARY JACOBSEN

Effect of chemicals on stimulus conduction between auricle and ventricle. GOMPEI MORITA. *Folia pharmacol. japon.* 4, 247-57(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 459.—The beat rate of the chloralized Straub heart under rhythmic elec. stimulation is the same as in the normal heart. If the frequency of the stimulus exceeds a certain rate the ratio beat rate/frequency becomes $1/2$, $1/3$, etc. In MgCl_2 , caffeine and ergotoxine poisoning the frequency at which the beat rate is reduced to $1/2$ is lower with auricle, than with ventricle stimulation. This points to an interference with stimulus conduction. The latter is apparently not paralyzed by quinine, emetine, cocaine, KCl, curare, CaCl_2 , veratrine, strophanthin, BaCl_2 or camphor since the decrease of beat rate appears at lower frequencies when the ventricle is stimulated. MARY JACOBSEN

Animal experiments on the reduction of blood coagulation time. BUNJI SAWADA. *J. Oriental Med.* 5, 73(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 402.—Na citrate in doses of 0.1-0.2 g./kg. rabbit hastens coagulation. The effect appears soon after the injection and passes a max. 3 hrs. later. Doses of 0.3-0.4 g. have essentially the same effect and are distinctly toxic to rabbits. Na citrate should not be used as a styptic. MARY JACOBSEN

The active principle of opium when smoked. SEIKICHI NAKAJIMA AND SEIKO KUBOTA. *J. Orient. Med.* 6, 1-16(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 850.—At the temp. and pressure of the opium pipe morphine, narcotine and codeine are likely to sublimate. Fifteen % of the opium alkaloids were recovered from the smoke collected on absorbent cotton. The 3 alkaloids were identified. MARY JACOBSEN

The acidosis of syphilis and chemotherapy by means of arsenobenzenes. ORLANDO RANGEL. *Livro Primario Congr. Brasil. Pharm.* Oct., 1922, 117-29.—Mainly a digest of McDonagh's views. MARY JACOBSEN

The cumulative effect of a few heart remedies of the digitalis group. HIROAKI UTSUNOMIYA. *Okayama Igakkai Zasshi* 1927, 71-90; *Ber. ges. Physiol. exptl. Pharmacol.* 40, 852.—Mice received repeated injections of a certain dose. The lethal dose was detd. in rabbits by means of 2 injections. The cumulative effect decreases in the following order: digitalis leaves (digitoxin) > digitamine, digitoline (digitalein) > strophanthine, scillaren > cymarin. MARY JACOBSEN

Comparative study of the action of curarizing poisons on skeletal muscle. RYUZO KATAGI. *Okayama Igakkai Zasshi* 1927, 213-30; *Ber. ges. Physiol. exptl. Pharmacol.* 40, 851.—Isolated gastrocnemii of frogs were studied after 1.5 hrs.' immersion in the toxic solns. Guanidine, adrenaline, tyramine and K in doses smaller than the paralyzing ones caused excitation of the motor endings. Among the poisons which attack the muscle before the nerve paralysis is complete, brucine, strychnine, guanidine, atropine, $\text{N}(\text{Et})_3\text{OH}$ and camphor cause initially excitation, while acetylcholine, $\text{N}(\text{Me})_3\text{OH}$, cinchophen Na salicylate and thebaine have only a paralyzing effect. The range of curarizing action (difference between nerve- and muscle-paralyzing concns.) decreases in the following order: $\text{N}(\text{Me})_3\text{OH}$, brucine, strychnine, acetylcholine, guanidine, tetrodotoxin, adrenaline, atropine, tyramine, K, $\text{N}(\text{Et})_3\text{OH}$, Na salicylate, thebaine, cinchophen. Nicotine seems to range after $\text{N}(\text{Me})_3\text{OH}$ according to Okusima. MARY JACOBSEN

The anomalies in the regulation of blood sugar under Röntgen irradiation. J. HISAMOTO AND M. TAKESHIMA. *Okayama Igakkai Zasshi* 39, 315-31(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 88.—Liver irradiation causes in rabbits an increase in blood sugar when the liver glycogen is high and a decrease when the glycogen is low. In both cases the effect is proportional to the dose. Irradiation of the thorax or lower abdomen of the rabbit causes considerable variations in the blood sugar. In the normal fasting dog liver irradiation is followed by a sugar decrease, more persistent and pronounced than in the rabbit. Man probably reacts in the same manner. M. J.

A new treponemicidal arsenic-bismuth preparation. DONATO BOCCIA AND ROBERTO MAGLIONE. *Rev. sud-americana endocrinol.-immunol., quimioterap.* 10, 491-8

(1927).—Dessy's new prepn. contains 0.02 g. Bi metal and 0.75 mg. As/cc. The tolerated dose is $\frac{1}{8}$ cc./kg. guinea pig. The max. therapeutic dose applied was 5 cc. Bi excretion in the urine begins on the 2nd day and ceases 3 days after discontinuation of the treatment. Intramuscular injections of 3 cc. in men, 1.5–2.0 cc. in women and children every 3rd to 7th day over a period of 10–20 days are almost painless and well tolerated. A kidney function test is desirable although no kidney affections were observed. Primary and secondary lesions disappear rapidly after 2–3 injections; the effect on the former is the same as that of neoursphenamine intravenously. The Wassermann test became negative in a no. of cases, but the short period of observation permits no final conclusion.

MARY JACOBSEN

The action of veratrine on skeletal muscle and an application of our knowledge of the segmentation of the frog gastrocnemius to the problem of the refractory phase of skeletal muscle in veratrine poisoning. S. DE BOER. *Verslag Akad. Wetenschappen Amsterdam* 36, 81–90(1927).—The gastrocnemius muscle of the frog consists of 2 groups of fibers, one of which is innervated by the 8th, the other by the 9th spinal nerve. Chemically as well as electrically the fibers function independently of each other. The tetanic contraction which is associated with intermittent elec. phenomena must be differentiated from the muscle tonus which is maintained by reflex and causes a continuous excursion of the galvanometer provided the current is drawn off monophasically. An induction stimulus applied to either the 8th or the 9th nerve will produce a steady excursion on the electrogram during the entire course of the veratrine contraction. A mechanical effect is apparent only on the ascending and descending parts of the veratrine curve; it is zero at its peak because at this stage the muscle has reached the max. contraction and cannot be shortened any more. Querido's conclusion that at the height of the veratrine contraction the muscle is refractory to induction stimulus is therefore erroneous.

MARY JACOBSEN

Effect of insulin on the morphological and chemical condition of the blood. A. SCHMIDT AND R. SAATCIAN. *Zurnal eksper. biol. mediciny* 4, 353–79(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 86.—The solids of the blood are more or less distinctly increased by insulin. The d. of the serum is slightly lowered but convulsions cause an increase. The petroleum ether ext. is diminished. The non-protein N shows no significant changes. The serum Ca is always lowered; convulsions cause a 30% increase. The changes in Ca are probably detd. by a shifting of the acid-base relation. The inorg. P is always lowered by 30% even in absence of hypoglycemia. There is a 50% increase in convulsions. The following hypothesis is advanced: Insulin promotes the formation of lactacidogen, which is split during the convulsions. The P is swept into the blood.

MARY JACOBSEN

Effect of lecthin on curare poisoning. A. VINOGRADOV. *Zurnal eksper. biol. mediciny* 4, 657–63(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 851.—When given before the curare poisoning lecthin either aggravates or counteracts the action of curare, the effect depending on its dose and mode of administration.

MARY JACOBSEN

Effect of morphine on the gastric secretion of dogs in hunger. A. SMIRNOV AND V. SIROKIJ. *Zurnal eksper. biol. mediciny* 4, 694–711(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 41, 72–3.—The effect of morphine on gastric secretion is controlled by the vagus center. Intense secretion is produced by 0.005–0.01 g. morphine, a max. being reached in 1 1.5 hrs. Secretion begins 1.5–2 hrs. after the injection of 0.05 to 0.06 g. In some dogs the promptest and greatest effect is produced by 0.01; in others by 0.005 g. The secretion caused by morphine is checked for 1.5 to 2 hrs. by 0.0005 to 0.001 g. atropine. Vagotomy at the neck abolishes secretion.

MARY JACOBSEN

The vagotropic action of adrenaline. A. SMIRNOV AND V. SIROKIJ. *Zurnal eksper. biol. mediciny* 4, 851–62(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 848.—The vagotropic action of adrenaline is favored by an increased tonus of the vagus centers. The antagonism adrenaline-Mg resembles that of Ca-Mg. Adrenaline is an amphoteric hormone acting on both vagus and sympathetic; it acts on the former directly. M. J.

A biochemical investigation of tripanosome treatment with the "Bayer 205" preparation. O. A. STEPPUN, G. TZEISS AND S. S. BRYUKHONENKO. *Trans. Sci. Chem. Pharm. Inst.* 1923, No. 3, 49–52.—The influence of the "Bayer 205" prepn. on tripanosomes consists of two factors; it acts as a colloid with a large mol. and in a specific grouping of the atoms; upon injecting into the organism it causes a perturbation of the physicochemical state of the juices and prevents the coagulation of the blood. Another direct influence of the prepn. on tripanosomes is due to its being a carrier of complex groups of the naphthalene series.

J. S. JOFFE

Several pharmacological observations on the "Bayer 205" preparation. A. S. SOKOLOV. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 3, 64–8.—Doses of the prepn.

from 0.8 to 1.5 g. are lethal for rabbits weighing 2000 g. The characteristic symptoms of poisoning are produced: convulsions of the neck muscles and extremities. A frog can stand 10 times as much of the prepn. as the rabbit per unit wt. Upon injecting into the vein it increases the blood pressure and acts as a depressive on the breathing. The increase in blood pressure is apparently due to the spasms occurring in the periphery of the blood vessels.

J. S. JOFFE

Advantages of ethylene-oxygen in general anesthesia. G. A. JOHNSTONE. *Am. Med.* 33, 367-70(1927).

FRANCES KRASNOW

The treatment of approaching and existing diabetic coma. J. A. BUCHANAN. *Am. Med.* 33, 408-11(1927).—Details of insulin treatment are given and discussed briefly.

FRANCES KRASNOW

Ethylene as an anesthetic for general surgery. HUGH CABOT AND H. K. RANSOM. *Ann. Surgery* 86, 255-9(1927).

FRANCES KRASNOW

Blood changes under ethylene anesthesia. H. H. TROUT. *Ann. Surgery* 86, 260-7(1927).— C_2H_4O anesthesia produces less alteration of the blood sugar, no appreciable change in either the coagulation time or the bleeding time, and only a slight disturbance of the native complement when compared with any other of the now commonly employed anesthetics.

FRANCES KRASNOW

The anesthetic preferences of American surgeons (compiled from reports received from six hundred and forty surgeons). EDWIN MAC D. STANTON. *Ann. Surgery* 86, 273-7(1927).—Ether is used in 85% of the cases, ethylene in 5%, N_2O and O in 4%, ethylene and N_2O in 1% and $CHCl_3$ in practically none.

FRANCES KRASNOW

The colloidal lead treatment of malignant neoplasms. W. S. STONE AND L. F. CRAVER. *Ann. Surgery* 86, 347-61(1927).—Intravenous injection of lead does not offer a cure for malignant neoplasms. In cancer of the breast, especially in the bone metastases from the tumor, the lead alone can produce favorable changes. In malignant osteogenic sarcoma lead in conjunction with radiation offers a valuable method of treating such tumors.

FRANCES KRASNOW

Change in the lymphatic apparatus following arsenic poisoning. R. STRAUMANN. *Deut. Z. ges. gericht. Med.* 9, 266-90(1927).—The effect is described in detail.

F. K.

Fatal poisoning with a mixture of common alum, zinc sulfate and copper sulfate. ERNST ZIEMKE. *Deut. Z. ges. gericht. Med.* 9, 291-301(1927).—Case report and discussion.

FRANCES KRASNOW

The pathological anatomy of the vegetative nervous system in methanol poisoning. B. MOGLINITSKIE. *Deut. Z. ges. gericht. Med.* 9, 302-11(1927).—MeOH is a specific poison for the vegetative system.

FRANCES KRASNOW

The quinquivalent compounds of antimony in the treatment of kala-azar. I. Stibosan (von Heyden 471); an analysis of the results of the treatment of the first 104 cases. L. E. NAPIER. *Indian J. Med. Research* 14, 263-79(1926). II. No. 693 (von Heyden); an analysis of the results of the treatment of the first 61 cases. *Ibid* 15, 181-6(1927).—No. 693 is very valuable.

FRANCES KRASNOW

The treatment of Wassermann-positive cases of leprosy by a new oil-soluble mercury preparation. E. MUIR. *Indian J. Med. Research* 14, 291-2(1926).—Hg 33 (2 myristoxymercuri-3-hydroxybenzaldehyde) in hydnocarpus oil is a safe and effective remedy in the treatment of leprosy when the Wassermann reaction is positive.

F. K.

The treatment of plague with mercurochrome-220 soluble. P. P. B. NAIDU AND SHAMSHER JANG. *Indian J. Med. Research* 14, 323-7(1926).—Mercurochrome-220 sol. is lethal to the plague bacilli in a diln. of 1-3200 after contact for 15 min. When injected hyperdermically the drug is not lethal to rats in doses of 10 mg. It is not lethal to rabbits in doses up to 10 mg. per kg. wt. when inoculated intravenously. Doses, whether single or repeated, totaling from 5 to 73.5 mg., have no influence on plague in rabbits and rats.

FRANCES KRASNOW

An experimental investigation into the action of organic compounds of antimony. R. N. CHOPRA. *Indian J. Med. Research* 15, 41-8(1927); cf. C. A. 20, 2371. —All org. compds. of Sb produce a fall in the systemic blood pressure after intravenous injection. The acidity of the soln. is not an important factor. The pressure in the pulmonary artery and in the interior vena cava rises. With small doses the rise is small and is immediately compensated for. The blood vessels of the intestines, liver and spleen dilate; the kidney shows slight contraction. The influx of a large amt. of blood into the spleen and liver is probably an important factor in the curative effect of these compds. The respiration is only slightly stimulated with some compds. (tartrates) but with others it becomes irregular and jerky.

FRANCES KRASNOW

***Psoralea corylifolia* (Babchi). Its constituents, their pharmacological action and therapeutic properties.** R. N. CHOPRA AND NIHAR RANJAN CHATTERJEE. *Indian*

J. Med. Research 15, 49-56(1927)—The active principle of this plant is an essential oil. A fixed oil and a resin occur in large quantities but these are not active pharmacologically. Traces of a substance of alkaloidal nature are also present. FRANCES KRASNOW

The relationship of the color of rabbits to their susceptibility to insulin. H. W. ACTON AND J. P. BOSE. *Indian J. Med. Research 15, 89-96(1927)*.—Insulin causes a smaller reduction in the blood sugar of the albino than of the black rabbits. The adrenaline content in the blood of the albino animal is higher than in the black. F. K.

Studies on the toxicity for tetrachlorethylene, a new anthelmintic. A. S. SCHLINGMAN AND O. M. GRUHZIT. *J. Am. Vet. Med. Assoc. 71, 188-209(1927)*— C_2Cl_4 like CCl_4 is more hepatotoxic than nephrotoxic. The lesions of this new anthelmintic are not as severe as CCl_4 . Chickens show the greatest tolerance. Next in order are puppies, cats, foxes, sheep, cattle and horses. FRANCES KRASNOW

Anthelmintic efficiency of kamala and tetrachlorethylene in the treatment of chickens. A. S. SCHLINGMAN. *J. Am. Vet. Med. Assoc. 70, 514-9(1927)*; cf. C. A. 20, 1274, 2019.—In 1 g. doses kamala is an efficient teniacide and is not toxic for birds. In combination with 1 cc. of C_2Cl_4 its efficacy is greatly reduced. FRANCES KRASNOW

A treatment for liver-fluke infestation in goats. J. N. SHAW AND B. T. SIMMS. *J. Am. Vet. Med. Assoc. 71, 723-7(1927)*— CCl_4 in doses of 1 cc. is a satisfactory treatment. FRANCES KRASNOW

Insulin-glucose in surgical shock, with observations on two cases. M. N. TUASON. *J. Philippine Islands Med. Assoc. 7, 283-6(1927)*. Good results were obtained. FRANCES KRASNOW

The treatment of undulant fever by mercurochrome-220. G. R. ROSS AND A. P. MARTIN. *J. Trop. Med. 30, 165-70(1927)*.—Results are inconclusive. F. K.

The blood sugar of normal subjects after the intravenous injection of insulin. AARON BOBANSKY AND SUTHERLAND SIMPSON. *Quart. J. Exptl. Physiol. 17, 57-64(1927)*—The rate of development of hypoglycemia in adult men, after intravenous injection of 2 units of insulin, is constant, after a possible but in any case very brief latent period. The min. sugar values are reached at a definite time, which is indicated about 18 min. after the injection. Recovery begins immediately after the min. sugar value has been reached. It is complete in lean subjects within 75 min. In overweight subjects the rate of recovery seems slower. FRANCES KRASNOW

The effects of insulin injection upon the body and organs of the white rat. P. T. HERRING. *Quart. J. Exptl. Physiol. 17, 119-24(1927)*—Insulin in doses insufficient to produce convulsions has no effect upon the rate of growth in white rats. Insulin injection has no appreciable effect on the wt. of the thyroids, pituitary body, suprarenals, thymus, spleen, heart, kidneys, liver, testes and ovaries. The islands of Langerhans are increased in size and stain more deeply with eosin. FRANCES KRASNOW

The influence of temperature on the course of strychnine tetanus. G. F. LORENZ. *Z. Biol. 85, 167-74(1926)*.—Physiological. FRANCES KRASNOW

Changes in physiological function of the nerves through the influence of amines like choline and neurine. J. I. PERICHANJANZ. *Z. Biol. 85, 289-98(1926)*.—The immediate effect of choline is to weaken greatly the tissue although at the end of 1.5 hrs. of treatment its function is entirely preserved. The cond. is only slightly impaired. In concns of 1% neurine lowers greatly the nerve irritability. Washing with normal NaCl soln. does not restore the function. MeCN also depresses the nerve activity. In this instance perfusion with NaCl soln. restores the irritability. Urea increases nerve irritability and cond. FRANCES KRASNOW

Changes in the ventricular contraction due to calcium chloride and potassium chloride. E. HOLZLOHNER. *Z. Biol. 85, 485-98(1927)*.— CaCl_2 causes marked retardation of the diastolic descent in the mechanogram with a corresponding extension on the electrocardiogram. While, by means of CaCl_2 , the velocity rise is retarded, there appears an acceleration of the mechanogram. The reverse is true with KCl. Just as in the case of KCl and the activity at the anode, it is more difficult to influence the flow at the base than at the apex. FRANCES KRASNOW

Toxicity of zinc. V. G. HELLER AND A. D. BURKE. *J. Biol. Chem. 74, 85-93(1927)*.—The possibility of poisoning from buttermilk stored in Zn-lined containers was investigated. Buttermilk normally contains a trace of Zn but the amt. is increased with the acidity of the milk, the time of storage and the newness of the Zn container. When pure Zn dust, ZnO , or certain Zn salts are added to a normal ration in amts. as great as are ever found in contaminated foods, there was no interference with growth, reproduction and normal functions of the rat through 3 generations. No pathol. conditions were found in the organs of the rat and the amt. of Zn was only slightly larger than that nor-

mally present. Zn is primarily excreted through the feces though in Zn-fed animals there is a slight increase in the quantity in the urine. A. P. LOTHROP

The nitrogen metabolism in experimental subacute arsenic and antimony poisoning. EMIL PRIBYL. *J. Biol. Chem.* **74**, 775-81 (1927).—In exptl. subacute poisoning in 4 rabbits by Na_2AsO_3 and by Sb K tartrate there is an increase in the non-protein N in the blood. The increase is more apparent in As poisoning and is due to a rise in the urea N. The rise in non-protein and urea N is assocd. with an increase in these substances in the urine. The NH_3 N quotient in the urine of the poisoned rabbits seems to be inversely proportional to the urea-N quotient. The acceleration of protein metabolism is attributed mainly to increased autolysis of tissues. A. P. LOTHROP

Detoxication of benzoic acid in man. J. I. BRAKEFIELD. *J. Biol. Chem.* **74**, 783-5 (1927).—Doses of BzONa which would yield 5-6 g. of BzOH were given to subjects who felt no ill effects from the ingestion of such large amts. of the BzONa . The acid was detoxicated in 10 hrs and was excreted as hippuric acid. In no case was there a detectable amt. of benzoylglucuronic acid present in the urine, a compd. which is found under similar circumstances in the urine of the dog and pig. A. P. LOTHROP

The effect upon rats of long-continued ingestion of zinc compounds, with especial reference to the relation of zinc excretion to zinc intake. KATHERINE R. DRINKER, PHIBBE K. THOMPSON AND MARION MARSH. *Am. J. Physiol.* **81**, 284-306 (1927); cf. *C. A.* **21**, 2325.—Daily doses of Zn, ranging from 0.5 to 34.4 mg. in the form of ZnO , $(\text{AcO})_2\text{Zn}$, Zn citrate and Zn malate over periods of from 35 to 53 weeks had no noticeable effect on the health of the animals (rats), nor did Zn accumulate in the tissues. Most of the Zn given was excreted in the feces, but a small fraction left the body through the kidneys. J. F. LYMAN

The effect of some secretogogs on the chemical composition of the pancreatic juice. E. V. STILL AND O. W. BARLOW. *Am. J. Physiol.* **81**, 341-8 (1927).—Four types of secretogogs were employed: secretin prepns; vasodilating; parasympathetic nerve ending stimulants; HCl in the intestine. Each type of secretogog gave a characteristic type of juice. Those juices that were high in H_2O and of low sp. gr. were high in lipase, while those that were high in protein and of high sp. gr. were relatively high in trypsin. J. F. LYMAN

The prevention of tetany by oral administration of magnesium lactate. W. F. WENNER. *Am. J. Physiol.* **81**, 392-404 (1927); cf. *C. A.* **21**, 1489.—Continuous oral administration of Mg lactate was an effective agent in the prevention of tetany in parathyroidectomized dogs; the lactates of Cd, Na and K were without effect. Mg appeared to keep the Ca content of the blood above the tetany level, possibly by combining with the excess P and thus keeping the Ca in solu. J. F. LYMAN

Morphine intoxication in adrenalectomized rats. A. TORINO AND J. T. LEWIS. *Am. J. Physiol.* **81**, 405-13 (1927).—Adrenalectomized rats 2 weeks after operation were highly susceptible to morphine, usually succumbing to 0.1 the lethal dose for normal rats. The amt. of morphine required to produce hypoglycemia in rats was only about 0.1 as much in the adrenalectomized animal as in the normal. J. F. LYMAN

Sensitiveness of adrenalectomized rats to certain toxic substances. C. A. CRIVELARI. *Am. J. Physiol.* **81**, 414-21 (1927).—Two or three weeks after adrenalectomy rats are more sensitive than normal rats to the toxic action of KCN, nicotine, acetonitrile and histamine. J. F. LYMAN

The effect of cobalt and insulin hypoglycemia in rabbits. N. R. BLATHERWICK AND M. SAHYUN. *Am. J. Physiol.* **81**, 560-2 (1927).— $\text{Co}(\text{NO}_3)_2$ was without appreciable effect on the insulin hypoglycemia in rabbits, contrary to the results of Bertrand and Macheboeuf (*C. A.* **20**, 3041). J. F. LYMAN

The influence of potassium iodide and thyroid preparations upon the blood sugar curve. OESTEN HOLSTI. *Acta med. scand.* **66**, 461-6 (1927).—The effect of KI and of thyroid medication was studied in 6 patients with subnormal blood sugar curves, whereby only the latter caused a rise in the curve which persisted even a month after treatment. Thyroid medication is indicated in such cases also from a clinical point of view. S. MORGULIS

The physiological indifference of capsanthin. B. V. ISSEKUTZ AND L. ZECHMEISTER. *Biochem. Z.* **185**, 1-2 (1927).—Capsanthin is the red pigment of ripe paprika and resembles somewhat carotins but has the formula $\text{C}_{44}\text{H}_{68}\text{O}_2$. About 4 g. can be obtained from 1 kg. paprika shells. Physiologically the pigment is inactive, probably because of its slight soly. S. MORGULIS

Further studies on the optimum dosage of active iron oxide for influencing metabolism. GERHARD ROSENKRAZ. *Biochem. Z.* **185**, 320-7 (1927).—The oral administra-

tion of 2.5-5 mg. of Baudisch active iron oxide per kg. and per day increases the utilization of food in the intestine. S. MORGULIS

The alteration of pharmacological action of autonomic nerve drugs through capillary active substances. L. ASHER AND N. SCHEINFINKEL. *Biochem. Z.* **186**, 87-94 (1927).—Atropine can be made a strongly stimulating drug for the vagus nerve through the influence of cholates as well as caprylic alc. and certain quinine derivs. Organ exts., except those of liver, do not invert the action of atropine. The addn. of capillary active substances to the frog heart treated with ergotamine causes definite acceleration when the vagus is stimulated, whereas ergotamine alone paralyzes the accelerans nerve. S. M.

The central regulation of the water metabolism. IV. The inhibition of the diuretic action of caffeine and theobromine through midbrain narcosis. HANS MOLITOR AND E. P. PICK. *Biochem. Z.* **186**, 130-8 (1927); cf. *C. A.* **20**, 2532.—Small, non-narcotic doses of chloretone or isopral inhibit the diuretic action of caffeine and theobromine in rabbits; certain prepn. of Caldrian act similarly but much larger doses are required. Luminal in non-narcotic doses inhibits the water diuresis in dogs. Chloral hydrate increases caffeine diuresis in small narcotic doses (cerebral narcosis) but with larger doses causing deep narcosis (midbrain narcosis) the diuresis is stopped. Paraldehyde, a cerebral narcotic, increases caffeine diuresis through the inhibition of the diuretic center, while the simultaneous administration of paraldehyde and chloretone completely suppresses caffeine diuresis. S. MORGULIS

Solubility and distribution of chloroform in blood. HANS WINTERSTEIN AND ELSE HIRSCHBERG. *Biochem. Z.* **186**, 172-7 (1927).—The max. soly. of CHCl_3 at room temp. in H_2O is 0.55% (by wt.); 0.5% in physiol. soln., 0.56-0.77% in serum or 0.75-0.86% in whole blood. The distribution of CHCl_3 between cells and plasma depends upon the absolute concn. of the CHCl_3 . At satn. the concn. in the cells is almost double that in the plasma, whereas with low concns. of CHCl_3 the cells may contain 4-6 times as much as the plasma. This leads to the conclusion that adsorption plays an important part in the distribution of CHCl_3 in the cellular elements of the blood. S. M.

Physicochemical studies on illumined proteins. I. Changes in serum albumin exposed to ultra-violet rays and their relation to heat coagulation. MONA SPIEGEL-ADOLF. *Biochem. Z.* **186**, 181-93 (1927).—Electrolyte-free serum albumin coagulates under the influence of ultra-violet light as under the influence of heat, but the coagulum cannot, as in the latter case, be converted into a water-sol. product by treatment with alkali and subsequent dialysis. Ultra-violet light causes changes in serum albumin in the presence of acids or alkalies under conditions under which it generally escapes alterations through heat. Serum albumin exposed to ultra-violet light in the presence of HCl can be pptd. by subsequent addn. of salt, which is unlike the behavior of the heat-treated material. Even large concns. of neutral salt do not prevent the coagulation of serum albumin by ultra-violet light, but the pptn. is inhibited by salts with polyvalent ions. On the contrary, KSCN neither inhibits the pptn. by ultra-violet rays nor does it aid in the resoln. of the coagulum as it does in heat coagulation. S. MORGULIS

The effect of arsenic on the hemolysis by raying and water. L. LÖHNER. *Biochem. Z.* **186**, 194-202 (1927).—The non-sensitized erythrocytes of rabbits undergo hemolysis at an altitude of 1650 m. under the influence of the sunlight in spring. The blood cells from various other species behave similarly, and even the intensity of the ultra-violet rays of the winter sun is sufficient for this purpose. Solns. of As_2O_3 , which increase the resistance of red blood cells to water, saponin or bile hemolysis, are not effective against the hemolyzing action of the light. On the contrary, suspensions of red cells in As_2O_3 solns. may even betray an accelerated hemolysis when exposed either to sunlight or to artificial illumination with ultra-violet rays, which indicates that As is a sensitizer to x-rays and ultra-violet rays. S. MORGULIS

Effect of sex on alcohol action. EMIL ABDERHALDEN AND ERNST WERTHEIMER. *Biochem. Z.* **186**, 252-4 (1927).—Female mice are much more resistant to chronic alc. poisoning than male animals. S. MORGULIS

Effect of increased calcium administration on the dystrophic calcification of the kidney in rabbits. IGOR REMEZOV. *Biochem. Z.* **187**, 51-6 (1927); cf. *C. A.* **20**, 1847.—Intravenous injections of Ca salts increase considerably the dystrophic calcification process in the ligated kidney of the rabbit as well as in the normal kidney. No definite conclusions can be drawn from subcutaneous Ca injections; neither does feeding of Ca salts produce any definite rise in Ca content of the dystrophic kidney. The normal kidney shows a tendency to an increased Ca content under all conditions of administration. The satn. of the tissues surrounding the calcified kidney with Ca salts has a strong influence on the calcification process. S. MORGULIS

Observations on the consequences of intraperitoneal administration of phenyl-

alanine and tyrosine to rabbits with denervated kidneys. N. F. SHAMBOUGH AND G. M. CURTIS. *Biochem. Z.* **187**, 437-43 (1927).—Tyrosine inhibits the strong urine excretion due to denervation or the euphylin diuresis. Even in acute expts. the administration of tyrosine produced serious morphological injury in the liver. Denervation does not prevent the kidney from remaining normal for a long time. S. M.

The behavior of phenylalanine and tyrosine under the influence of purine diuresis. N. F. SHAMBOUGH. *Biochem. Z.* **187**, 441-460 (1927).—Intraperitoneal injection of a slightly alk. NaCl soln. inhibits the effect of a specific diuretic. A comparison of the diuresis resulting from the peritoneal injection of phenylalanine and tyrosine or of a specific diuretic reveals a different reaction of the organism towards these 2 amino acids. Repeated tyrosine injections cause serious liver injury. By the oral administration of phenylalanine and tyrosine no differences appear during an exptl. interval of 6 hrs. S. MORGULIS

A sample of "pot-curare." C. G. SANTESSON. *Skand. Arch. Physiol.* **52**, 209-21 (1927).—Curare ext. packed with palm leaves in burned earthenware pots is an article of exchange among South American Indians. It has a very variable potency. An analysis of one of the best samples of "pot-curare" showed the presence of 8% ash rich in K_2SO_4 and Mn; the poisonous alkaloid protocurarine ($C_{19}H_{25}NO_2$?); the much less effective alkaloid protocurine $C_{20}H_{27}NO_3$; the insol. and non-poisonous proto-curidine, $C_{19}H_{21}NO_3$, and at least one curine-like base which in large doses causes paralysis in frogs with disturbance of heart action. S. MORGULIS

The effects produced by the inhalation of hematite and iron dusts in guinea pigs. H. M. CARLETON. *J. Hyg.* **26**, 227-34 (1927).—Hematite inhalation causes an immediate proliferation of alveolar epithelium and a mild bronchitis. The reaction is much less than with flint, ground pitcher, feldspar, or china clay dusts. Iron dust is more harmful than hematite, causing a greater inflammatory reaction and some fibrosis. JOHN T. MYERS

The effect of mineral acid on acid-base regulation in health and in nephritis. G. C. LINDER. *Quart. J. Med.* **20**, 285-302 (1927).—Dil HCl in quantities corresponding to 500-1000 cc of 0.1 N HCl per day were given to 4 normal persons and 6 nephritics for from 2 to 4 days. In normal cases, a quantity of fixed base was available for excretion with the acid. This was exhausted in 2 or 3 days and its place taken by NH_3 . In chronic hydremic nephritis without gross edema, there was an adequate response in NH_3 formation but the supply of fixed base was lacking. Azotemic patients showed a diminished power to form extra NH_3 . This defect became greater as renal function failed. In compensation there was a greater excretion of fixed base derived largely from cellular waste. The serum chlorides increased, and total base, bicarbonates and pH decreased. In 2 cases with greatly impaired renal function a severe acidosis followed the administration of HCl. JOHN T. MYERS

Hypoglycemic properties of galegine sulfate. H. SIMONNET AND G. TANRET. *Bull. soc. chim. biol.* **9**, 938-27 (1927); see *C. A.* **21**, 3088. L. W. RIGGS

Action of bile and of bile salts upon cardiac conductivity and excitability. LOUIS LYON-CAEN. *Compt. rend. soc. biol.* **97**, 216-7 (1927).—Expts. were made with the frog heart by intraperitoneal injection, or injection into the lymph sacs, of pure dog bile, also of 1 to 4% solns. of Poulenc bile salts in physiol. saline. In a second series the heart was impregnated directly. Cardiac conductivity was diminished by bile and by 1% solns. of the salts. The excitability was diminished only by solns. of bile salts of a concn. of 4% and upwards. L. W. RIGGS

Reinforcement of immunity by the injection of starchy substances. J. A. SICARD, JEAN PARAF AND ROBERT WALLICH. *Compt. rend. soc. biol.* **97**, 217-9 (1927). L. W. RIGGS

Peripheral vasomotor action of extracts of the posterior lobe of the hypophysis. AMIAUX, L. BROUHA AND H. SIMONNET. *Compt. rend. soc. biol.* **97**, 233-4 (1927).—Tests with dogs show that the ext. of the posterior lobe of the hypophysis exercises a peripheral hypertensive action. This action is produced by doses which modify neither the general blood pressure nor the cardiac rhythm. The action, when the injection is made in the paw of the dog, does not depend on the integrity of the nerve connections of the paw, but on the local vasomotor tonus existing in the paw at the moment of injection. This technic may be employed for standardizing post-hypophysis preps. L. W. RIGGS

Variations in the glucose content of blood following intravenous and intracardiac injections of histamine. S. KATZENELBOGEN AND A. ABRAMSON. *Compt. rend. soc. biol.* **97**, 240-1 (1927).—Fatal doses of histamine in rabbits and guinea pigs are accompanied by hypoglycemia; when the reaction is slight or moderate, hyperglycemia results. L. W. RIGGS

Hypoglucemic action of ergotamine in diabetes. HENRI MORETTI. *Compt. rend. soc. biol.* **97**, 320-4 (1927).—Ergotamine administered hypodermically or by the gastric route caused variable reductions of glucemia and of glucosuria in the 7 cases studied, and is capable of acting in insulin resistant cases. L. W. RIGGS

Action of x-rays on the tumor of Rous. A. LACASSAGNE, C. LEVADITI AND J. GALLOWAY. *Compt. rend. soc. biol.* **97**, 336-8 (1927).—Fresh fragments and filtrates from the tumor of Rous retain their virulence, notwithstanding their treatment with x-rays, acting either upon the tumor *in vivo* following late inoculation, or *in vitro*. Small doses of the rays properly administered arrest the development and sterilize such a tumor left in place. L. W. RIGGS

Action of the calcium ion on the excitability of the cardiac accelerator nerves. J. J. BOUCKAERT AND EDW. CZARNECKI. *Compt. rend. soc. biol.* **97**, 353-6 (1927).—Expts. with dogs indicated that a diminution in Ca ions lessened the excitability of the cardiac accelerator nerves. **Condition of excitability of secretory nerves.** *Chorda tympani.* J. J. BOUCKAERT AND JEANNE HURYNOWICZ. *Ibid* 356-8.—The diminution of Ca ions acts upon the chorda tympani, the same as upon other nerves of a parasympathetic nature, to diminish its excitability. **Bile secretion after injection of decalcifying salts.** J. J. BOUCKAERT AND SAADI-NAZIM. *Ibid* 359-60.—Tests with dogs showed that the reaction of the hepatic cells to the injection of bile is identical before and after the injection of decalcifying salts. This fact supports the idea of nonintervention of the nervous system in the secretion of bile. L. W. RIGGS

Experimental lead poisoning. Nitrogen metabolism. M. PAVLOFF. *Compt. rend. soc. biol.* **97**, 361-2 (1927); cf. following abstr.—Rabbits, cats and dogs were the subjects used. The first stage of plumbism, about 3 months in duration, is accompanied by a loss of wt. of 13 to 22%. The urine diminishes in daily quantity up to the end of poisoning, when it may be but 50%, and its acidity increases. During the first weeks the quantity of urinary N increases as the wt. of the subject decreases. Later as the body wt. becomes more stable the quantity of urinary N diminishes. The secretion of creatine is intensified during the first and last periods of the intoxication. The total N of the blood diminishes slowly, the residual N is lowered during the first period and remains below normal throughout the intoxication. Uric acid in the blood is increased during the first and last periods; in the middle period the uric acid in the blood approaches the normal figure. The elimination of uric acid in the urine is diminished. L. W. RIGGS

Experimental lead poisoning. Sugar, lipid and mineral metabolism. M. PAVLOFF. *Compt. rend. soc. biol.* **97**, 430-1 (1927); cf. preceding abstr.—At the beginning of Pb intoxication the blood sugar increases; it attains its max. toward the middle of the term of poisoning and then diminishes progressively to normal. Lipoids produced at the expense of cholesterol increase and cholesterol usually increases during the first period of intoxication. Toward the end the cholesterol approaches the normal figure or may fall below. With mineral compds. there is first an enrichment due to the passage of chlorides from the cells to the blood. The proportion of Ca diminishes. During the poisoning the coagulability, viscosity and fibrinogen of the blood increase. L. W. R.

Action of carbonic acid by inhalation on the respiratory apparatus. S. BONNAMOURE, MILHAUD AND J. LANGÉNEUX. *Compt. rend. soc. biol.* **97**, 483-4 (1927); cf. *C. A.* **21**, 2739.—Rabbits were subjected to inhalations of mixts. of air and CO₂ contg. from 15 to 60% of CO₂. The resulting symptoms agree with those observed in animals subjected to subcutaneous, intraperitoneal or intrarectal injections of CO₂. L. W. RIGGS

Prolonged anticoagulating action of hirudin and leech extracts administered subcutaneously. A. JOSSERAND AND J. JEANNIN. *Compt. rend. soc. biol.* **97**, 493-5 (1927).—A rabbit weighing 2 kg. received a subcutaneous injection of a maceration of 6 leech heads in 10 cc. physiol. saline. Before injection the time of coagulation of a drop of blood on a slide was 4 min., 2 hrs. after the injection it was 10 min., 6 hrs. 21 min., 14 hrs. 14 min., 21 hrs. 9 min. and 25 hrs. 4.5 min. The subcutaneous injection of hirudin causes a hypocoagulability which persists for several days which returns progressively to normal. L. W. RIGGS

Cholesterol and intoxication by carbon monoxide and by hydrogen arsenide. G. MOURIOUAND AND A. LEULIER. *Compt. rend. soc. biol.* **97**, 498-9 (1927).—Guinea pigs subjected to illuminating gas and to H₃As showed no significant change in the distribution of cholesterol in the suprarenals, spleen, liver, lungs or blood. L. W. R.

Chemical regulation of cardiac activity. Effect of certain tissue products on the coronary circulation. L. STERN, S. RAPOPORT AND A. SCHARIKOWA. *Compt. rend. soc. biol.* **97**, 509-11 (1927).—Perfusion expts. with the isolated hearts of cats and rabbits were made by the method of Stern and Rothlin (cf. *C. A.* **14**, 1138, 2210). Coronary

flow is lessened by preps. of thyroid, ovary, testicle, spleen, liver, muscle and brain.

L. W. RIGGS

Influence of the injection of catalase into the circulation upon the content of different tissues in catalase and in anticalase. L. G. BELKINA, R. N. FALK AND L. L. KREMLEV. *Compt. rend. soc. biol.* 97, 525-6(1927).—Catalase injected into the circulation of rabbits disappears completely in 3 hrs. In the tissues there is at first an increase of catalase, followed by a gradual return to the normal figure in 3 hrs. The largest accumulations of catalase were in the kidney and muscles where it attained a max. in about 1 hr. Variations in anticalase were without regularity except in the liver where it was diminished in the majority of cases.

L. W. RIGGS

Influence of various physiologic and pathologic factors on the functioning of the hematoencephalic barrier. Influence of the para-sympathetic system. L. STERN, A. SLATOWIEROW AND L. BELKINA. *Compt. rend. soc. biol.* 97, 526-7(1927).—The intravenous administration of atropine to rabbits or cats did not diminish the normal resistance of the hematoencephalic barrier to crystalloids, but did diminish its resistance to colloids in some cases. The injection of pilocarpine was without effect on the activity of the barrier toward either crystalloids or colloids.

L. W. RIGGS

External secretion of the pancreas after the injection of decalcifying salts. SADAI-NAZIM AND J. J. BOUCKAERT. *Compt. rend. soc. biol.* 97, 567-70(1927).—Injection of decalcifying salts in dogs does not modify appreciably the external secretion of the pancreas caused by pilocarpine or histamine.

L. W. RIGGS

Action of norhomoephedrine on the isolated heart of the frog and of the snail compared with that of native ephedrine and of β -tetrahydronaphthylamine. (Mlle.) JEANNE LÉVY AND PAUL BOYER. *Compt. rend. soc. biol.* 97, 572-6(1927).—With the perfused frog heart the action of ephedrine and of norhomoephedrine is to diminish the amplitude and frequency, and arrest the heart in diastole. Norhomoephedrine produces the results with much smaller doses. β -Tetrahydronaphthylamine 1 in 1000 arrests the heart in 3 min.; it never increases the amplitude. With the snail heart strong doses of native ephedrine cause immediate arrest in systole. Doses of from 1 in 100 to 1 in 1000 diminish the frequency, increase the amplitude and cause a temporary arrest following 3 or 4 contractions, of which the first has the greatest amplitude. Norhomoephedrine causes the same reactions but more intensely. β -Tetrahydronaphthylamine 1 in 500 arrests the heart in systole in about the same time as norhomoephedrine 1 in 200.

L. W. RIGGS

Sensibility of hypophysectomized dogs to the action of insulin. B. A. HOUSSAY AND M. A. MAGENTA. *Compt. rend. soc. biol.* 97, 596-7(1927).—The hypoglycemia following a dose of insulin is more pronounced, rapid and durable in dogs deprived of the hypophysis.

L. W. RIGGS

Dental and osseous alterations in chronic intoxication by fluorine. CARLOS BERGARA. *Compt. rend. soc. biol.* 97, 600-2(1927).—White rats subjected to prolonged administration of NaF showed a retarded ossification of the connective cartilages and a greater transparency of bones to x-rays. The incisor teeth gradually lose their reddish yellow color, becoming at first more opaque and lighter, then later with dark bands. The superior incisors increase in size and the inferior diminish.

L. W. RIGGS

Diphtheria toxin and adrenaline of the suprarenals. G. MOURMQUAND, A. LEULIER AND P. SEDALLIAN. *Compt. rend.* 184, 1359-60(1927); cf. C. A. 21, 3677.—Diphtheria toxin causes a diminution in the adrenaline content of the suprarenal medulla of the guinea pig; but with animals killed 8-10 hrs. after the injection of the toxin this diminution was observed in only 50% of the cases studied. With animals killed 15-20 hrs. after injection the diminution of adrenaline was general. The diphtheria toxin allows a certain proportion of "virtual" adrenaline to exist, and this quantity becomes very slight when the content of free adrenaline in the fresh capsules is large.

L. W. RIGGS

Vasoconstrictor action of hydrastine. F. MERCIER AND RAYMOND-HAMET. *Compt. rend.* 185, 363-5(1927).—In curarized or unanesthetized dogs, hydrastine (2 mg. per kg.) causes a rise of blood pressure and renal vasoconstriction; in dogs narcotized with chloralose, it causes lowering of blood pressure.

L. W. RIGGS

Proportion of nitrous vapors in the vicinity of an arc lamp used for medical treatment. J. DADLEZ. *Compt. rend.* 185, 420-2(1927).—The analytical method of Kohn-Abrest was used. Irritation was produced by 0.14-0.16 mg. of nitrous vapors per l. of air. A concn. of 0.01 mg. per l. caused no irritation in 30 min. In a space of 50 cu. m. and 50-80 cm. from the lamp, the current passing 2 to 30 min., the quantity of nitrous vapors varied from 0 to 0.15 mg. per l. In a space of 14 cu. m. at a distance of 50-70 cm. from the lamp the nitrous content was 0.17-0.22 mg. per l. The use of the arc lamp

in medical treatment should be accompanied by thorough ventilation of the space near the lamp. L. W. RIGGS

Bromide intoxication. U. J. WILE. *J. Am. Med. Assoc.* **89**, 340-1(1927).—Previous studies have shown that ingested bromide was with difficulty passed through the renal epithelium, consequently bromides tend to become stored in the tissues of the body. Bromide displaces the chloride ion in the body; the ingestion of the former leads to the rapid elimination of the latter, and to chloride deficiency. In cases of bromide intoxication, the intravenous injection of physiologic NaCl soln. leads to the liberation of the bromide from the tissues, occasionally accompanied by a sharp renal irritation. The work reported in the present paper confirms the foregoing conclusions. L. W. R.

The hematopoietic effects of intravenously injected nucleic acids. OLOF LARSELL, N. W. JONES, H. T. NOKES AND B. I. PHILLIPS. *J. Am. Med. Assoc.* **89**, 682-5(1927); cf. *Arch. Path. Lab. Med.* **2**, 698-703(Nov., 1926).—Washed nuclei from the red-blood cells of the fowl, injected into normal rabbits intravenously, produce marked hematopoietic stimulation. The cytoplasm from which the nuclei have been removed does not produce hematopoietic stimulation. Nucleic acids (and nucleoproteins?) obtained from the washed nuclei of the red-blood cells of the fowl, injected intravenously into normal rabbits and into anemic human patients, produce results similar to that resulting from the injection of the nuclei themselves. Injections of Na salts of nucleic acids do not appear to cause deleterious effects in normal rabbits, but in splenectomized rabbits a single injection caused depression and shock, the depression lasting for several days. One human patient splenectomized a year prior to the treatment showed similar effects. How the spleen acts in assimilating injected nucleic acids is not clear. L. W. RIGGS

Pharmacology of concentration changes. II. Mechanism of the adrenalin effect. L. JENDRASSIK AND E. MOSER. *Magyar Orvosi Archivum* **27**, 51-7(1926).—On surviving rabbit intestine, adrenalin given in Tyrode soln. is present in active concn. after the expiration of inhibition. If a new Tyrode soln. is applied to the intestine a transitory irritation follows. Apparently the effects of adrenalin result from concn. changes. **III. Action of the cations.** L. JENDRASSIK AND E. ANNAI. *Ibid* 58-68.—See C. A. **20**, 1860. **IV. Effect of anions.** L. JENDRASSIK AND L. ANTAI. *Ibid* 69-74.—The anions Br⁻, I⁻, SO₄²⁻, NO₃⁻, SCN⁻, F⁻, citrate, oxalate, CO₃²⁻, HCO₃⁻, and HPO₄²⁻ in the form of their Na salts affect rabbit intestine qualitatively in the same way. By an increase of their concns. they produce a transitory irritation, and by a decrease of their concns. a transitory paralysis. By complete or 50% substitution of the NaCl of Tyrode soln. by NaNO₂, NaBr, NaI or Na₂SO₄, the spontaneous movements nearly disappear. With fluoride and salts pptg. Ca, much smaller doses bring about the same results. Change in the content of bicarbonate, that is, the change in the H ion concn., can also cause potential effects. **V. Effects of alcohols and aldehydes on the intestines.** L. JENDRASSIK AND H. TANGL. *Ibid* 75-7.—See C. A. **21**, 454. L. W. R.

Cholagoges. J. SCHAFFLER. *Magyar Orvosi Archivum* **28**, 356-62(1927).—Only drug preps. contg. bile acids or cinchophen promote bile secretion. **Effect of nutrition upon bile secretion.** *Ibid* 363-70.—Neither aromatics nor liquids influence bile secretion. Some carbohydrates promote bile secretion but this is due to accompanying albumin. By increasing the quantity of albumin in the food the bile secretion can be increased up to a max. above which more albumin has no further action. Increasing the no. of meals proportionally increases the bile secretion. Thus 6 albumin-meals per day increase the bile 150%. A quantity of albumin divided and given at intervals is more effective than the same total quantity given at once. **Treatment of liver diseases.** *Ibid* 371-8.—In case of jaundice promotion of the bile secretion is injurious. In liver diseases which are not followed by jaundice, proper diet makes all drugs superfluous. L. W. RIGGS

Role of vitamins and insulin in nutrition. C. FUNK. *Paris Médical* **61**, 389 (1927); *J. Am. Med. Assoc.* **89**, 162; cf. C. A. **21**, 2495.—Substance A (vitamin A) represents the pancreatic hormone. Substance B, or anti-insulin, exerts an action antagonistic to that of insulin. Substance C, or co-insulin, is indispensable for activation of substance A. Unlike insulin substance A is without effect in healthy persons, while in diabetics it reduces the amt. of the blood sugar. In normal conditions the content of substance C in the blood is proportional to that of substance A. Introduction of substance A into the organism causes a surplus which cannot be activated, and consequently remains inert. In the blood of diabetic persons substance A is deficient, while the amt. of substance C is greatly increased. The fact that substance A reduces the blood sugar in diabetics is thus explained. Substance A does not cause hydermia or hypoglycemic shock which are sometimes observed with insulin. In rabbits substance B induced hyperglucemia accompanied by pancreatic disturbances. The animals lost

wt. and developed hydremia and grave anemia. Substances *A* and *B* are present in the pancreas and in the liver, and are found in almost all alimentary products. Cf. following abstr. L. W. RIGGS

Use of substance *A* of insulin in diabetic patients with cardiac lesions. C. FUNK. *Progrès Médical* 54, 245(1927); *J. Am. Med. Assoc.* 89, 163.—Isolated substance *A* may not be of much therapeutic importance in diabetes, until it becomes possible to isolate the activating substance *C*. But in diabetic patients with cardiac lesions, who do not tolerate insulin, substance *A*, which is c. p. and is atoxic, can be advantageously used. L. W. RIGGS

Toxicology of carbon monoxide. D. I. MACHT. *Science* 66, 198-9(1927).—Growth of roots from seeds of *Lupinus albus* is retarded by co-hemoglobin. L. W. R.

Action of tetrodon poison. SHIGETARO KIMURA. *Tôhoku J. Exptl. Med.* 9, 41-65 (1927).—*Tetrodon* poison or tetrodotoxin is derived from the ovary of the hedge-hog fish. It loses its poisoning power rather rapidly in the animal body by being either fixed or decompd. It is not eliminated by the kidneys. The blood serum, because of its alk., participates in the detoxication. Probably some other mechanism for detoxication takes place in the animal body. L. W. RIGGS

Comparative studies of pharmaceutical preparations of the digitalis group. KESUKE YAMANOUCHI. *Tôhoku J. Exptl. Med.* 9, 111-28(1927).—Prepns., made from the following 6 crude drugs belonging to the digitalis group so as to contain as much active but as little useless substances as possible, were compared with each other with regard to the intensity of their various actions, the same heart active dose or concn. being used. In the following table, which shows the relative intensity of the actions by taking the intensity of the actions of digitalis prepns., as 100, column I has the figures for local irritant action, II emetic action, III absorption from small intestine, IV absorption from cutaneous tissues, V persistency of cardiac action, and VI action on vagus center.

Preparation	I	II	III	IV	V	VI
Digitalis	100	100	100	100	100	100
Strophanthus	20	76	168	127	14	300
Convallaria	33	52	57	110	20	250
Scilla	100	48	53	72	20	88
Adonis	100	71	125	106	14	150
Rhodea	33	54	75	94	60	167

L. W. RIGGS

Effect of intravenously administered adrenaline upon the epinephrine output from the suprarenal body. TADASHI SUGAWARA, SHIZUKA SAITO AND MAMORU NEMOTO. *Tôhoku J. Exptl. Med.* 9, 149-206(1927).—Twenty-eight pp. of tables show that injected adrenaline in dogs and cats does not increase the epinephrine discharge from the suprarenal gland. L. W. RIGGS*

Influence of different drugs on the physiological reactions resulting from progressive oxygen dilution. II. Drugs which act on the central nervous system. RYŪZŌ YOSOMIYA. *Tôhoku J. Exptl. Med.* 9, 207-28(1927); cf. *C. A.* 21, 2739.—Under increased O diln. the rate of O absorption is decreased by morphine, urethan, luminal, veronal and antipyrine, and by morphine, luminal and veronal the O content of arterial blood is still more reduced to correspond with the decrease of O in the inspired air, while antipyrine and urethan show a tendency to retard and diminish this reduction. **III. Influence of inner secretions and vegetative nerve poisons.** *Ibid* 229-50.—The rate of O absorption increases after the administration of adrenaline and atropine, but generally decreases after pituitrin, pilocarpine and insulin. Many other physiol. reactions of these agents, and of the drugs mentioned above, are illustrated with graphs and are described in detail. L. W. RIGGS

Effect of strychnine on the rate of epinephrine output from the suprarenal glands of dogs. MASANOSUKÉ WATANABÉ. *Tôhoku J. Exptl. Med.* 9, 251-73(1927).—The rate of epinephrine liberation was detd. on the etherized dogs by means of the cava pocket method and the rabbit intestine segment method. Aq. solns. of strychnine sulfate or nitrate were generally administered intravenously, occasionally hypodermically. Small doses, less than 0.2 mg. per kg., and large doses of more than 4.0 mg. per kg., that is, the paralytic dose, were ineffective in causing an increased liberation of epinephrine from the suprarenal glands. Moderate doses of 0.25-3.0 mg. per kg. were invariably capable of causing an increased output of epinephrine, in some instances of 4-5 times the initial rate. About 10-20 min. after the administration the highest rate due to strychnine poisoning usually occurred and the increased discharge continued 20-40 min. after the

injection or longer. The occurrence of the augmentation depends on the integrity of the splanchnic nerves.

"Synthalin." P. IVERSEN AND J. MUNCK. *Ugeskrift for Laeger* 89, 533(1927); *J. Am. Med. Assoc.* 89, 924.—Overdoses of synthalin are poisonous. Together with the toxic effect it has a characteristic effect on the carbohydrate metabolism. The prepn. may have a limited value in the d'nic when insulin treatment is at an end. L. W. RIGGS

"Synthalin" treatment of diabetes mellitus. J. H. HOLST. *Ugeskrift for Laeger* 89, 540(1927); *J. Am. Med. Assoc.* 89, 924.—The individual tolerance for synthalin is variable and the effect on the blood sugar varies in different patients. It may have but slight effect with patients having a high glucosuria. It appears to be most effective in patients in whom the blood sugar concn varied widely during treatment with insulin. A positive or const. effect from the treatment was not seen in grave diabetes with marked hyperglucemia, glucosuria and acidosis. In such cases the hyperglucemia and acidosis should be reduced by diet before synthalin treatment is started. In transferring patients from even small doses of insulin to synthalin both should at first be given and the insulin reduced gradually if the synthalin proves effective. L. W. RIGGS

Physiological importance of glutathione. (MRS.) LUCIE RANDOIN. *Bull. soc. hyg. aliment* 15, 245-9(1927). A discussion of the properties of glutathione shows the possibility of its intervention in org. oxido-reductions, since it has been found that under phys. conditions which can occur *in vivo* it can transport O to substances of known biol. importance. R. considers that glutathione in particular, and compds. contg. an SH group in general, act on certain special products of basal cellular metabolism rather than in general metabolic processes

A. PAPINEAU-COUTURE

Treatment of bubonic plague by intravenous injections of colloidal iodine. C. GRIMES. *Bull. soc. pathol. exot* 19, 584(1926); *Colloides biol. clin. therap* 1, 41(1927).

A. PAPINEAU-COUTURE

The biological activity of colloids. B. G. DUHAMEL AND R. THIEULIN. *Colloides biol. clin. therap.* 1, 17-32, 61-71(1927).—The true therapeutic activity of inorg. colloids seems to be out of proportion with the importance of the phenomena observed in lab. expts. From expts. on so-called "colloidal shock," D. and T. conclude that: (1) The distribution in the organism of inorg. colloids injected intravenously suggests that the liver, blood and spleen participate in the biol. activity of these colloids (2) The phenomena of "colloidal shock" comprise a *hepatic shock* and a *hematic shock* (3) The hepatic shock is the manifestation of a complex defensive reaction starting in the liver, where the greater portion of the injected colloid rapidly assembles. (4) The study of autolyzed liver exts shows that, during colloidal shock, this organ acquires strong toxolytic properties (tested *in vitro* and *in vivo* on the toxins of *B. pyocyaneus*, *B. diphtheriae* and streptococcus). (5) These modifications of the toxolytic power of the liver coincide with a glycogenetic superactivity. (6) The hematic shock is characterized by a modification of the no., quantity and resistance of the leucocytes, and by humoral modifications comprising an increase in the agglutinative and opsonizing functions. (7) The increase of the agglutinative power of the serum during the colloidal shock is const. only in the case of colloids having a given elec. sign. The immediate sp. activity of colloids therefore seems to depend on the nature of their elec. charge. (8) The phagocytic coeff. increases during colloidal shock, this modification depending essentially on the opsonizing properties of the serum. (9) The hematic shock is mainly a humoral crisis, and apparently is subordinate to the hepatic shock. The greater part of the activity of colloids therefore depends on the liver.

A. P.-C.

Animal poisons. ANGELO CONTARDI AND PIA LATZER. *Giorn. chim. ind. applicata* 9, 55-62(1926).—Monograph on the properties of some animal poisons.

ROBERT S. POSMONTIER

The effects of guanidine compounds on the blood pressure when introduced slowly into the circulation and into the gastrointestinal tract. R. H. MAJOR. *Bull. Johns Hopkins Hosp.* 39, 215-21(1926).—No elevation of blood pressure results after the introduction of methylguanidine sulfate. It is absorbed from the gastrointestinal tract, largely from the ileum and much less from the stomach, duodenum, jejunum and colon.

G. F. REDDISH

Insulin treatment of undernutrition in nondiabetic subjects. R. FEISSLY. *Presse Méd.* 34, 196-9(1926).—Improvement was noted.

G. F. REDDISH

Cell poisoning by carbon monoxide. Annotation. ANON. *Lancet* 1927, I, 666.—The observations by J. B. S. Haldane (*Nature*) are discussed, namely, that motion in the wax moth and cress ceases when the O reaches 8.8% and CO 91%. On admitting air there is recovery in the moth in contrast to the effect on hemoglobin. The blood

of 29 out of 42 workers in garages in New York, who had no clinical symptoms, gave evidence of CO poisoning. F. B. SEIBERT

The peristaltic and antiperistaltic movements of segments of excised pig ureters as affected by drugs. C. M. GRUBER. *J. Pharmacol., Proc.* 31, 202-3(1927).—The effects of adrenaline, urea, nicotine, acetylcholine, atropine, pituitrin and Na phenobarbital were studied. GEORGE ERIC SIMPSON

Studies of the respiratory reflex effects of ether. II. In relation to urinary secretion. M. S. DOOLEY AND CHARLES J. WELLS. *J. Pharmacol., Proc.* 31, 204 (1927).—Ether (and other strongly irritant anesthetics in less degree) applied only to the upper part of the respiratory tract caused anuria. This is shown to be due to local irritation. GEORGE ERIC SIMPSON

Effect of potassium iodide on bronchoconstriction. A. D. HIRSCHFELDER AND GEORGE WILKINSON. *J. Pharmacol., Proc.* 31, 205(1927).—When 5 to 7 cc. of isotonic or hypertonic KI soln was injected into decerebrate guinea pigs previously treated with pilocarpine-HCl bronchodilation occurred. KCl was not so effective. Isotonic NaCl had no effect, but hypertonic solns. did. GEORGE ERIC SIMPSON

The action of indole and skatole on the heart. J. A. WADDELL. *J. Pharmacol., Proc.* 31, 205-6(1927).—They are depressant. GEORGE ERIC SIMPSON

The influence of the C_{10} of the blood on the reaction of the heart to drugs. WILLIAM SALANT AND J. E. NADLER. *J. Pharmacol., Proc.* 31, 206-7(1927).—The toxicity of *Hg succinate* and *cocaine* to the exposed heart of cats was increased following injection of acid and decreased after Na_2CO_3 . NaH_2PO_4 injections decreased the effectiveness of strophanthin. In the later stages of strophanthin poisoning, KH_2PO_4 had the opposite effect. GEORGE ERIC SIMPSON

Methemoglobinemia. T. K. KRUSE, W. S. McELROY AND C. C. GUTHRIE. *J. Pharmacol., Proc.* 31, 208-9(1927).—Methemoglobinemia was produced in dogs by oral administration of acetanilide. Except with large dogs, it did not last after 24 hrs.; there was a reversion to active hemoglobin. The methemoglobin of drawn blood changed to active hemoglobin on standing at room temp. Hemolyzed blood did not exhibit this reversal. GEORGE ERIC SIMPSON

The antagonism between quinine or quinidine and epinephrine. ERWIN E. NELSON. *J. Pharmacol., Proc.* 31, 209-10(1927). GEORGE ERIC SIMPSON

Blood sugar in dogs during morphine tolerance and withdrawal. I. H. PIERCE AND O. H. PLANT. *J. Pharmacol., Proc.* 31, 210(1927).—The blood sugar curve showed (a) abrupt rise after the beginning of the dosage; (b) generally elevated level in early stages of tolerance; (c) generally lowered level later in tolerance; (d) abrupt rise after withdrawal, followed by a return to normal. GEORGE ERIC SIMPSON

General symptoms and behavior of dogs during morphine tolerance and withdrawal. O. H. PLANT AND I. H. PIERCE. *J. Pharmacol., Proc.* 31, 210-1(1927). GEORGE ERIC SIMPSON

Excretion of morphine during gradually produced and prolonged tolerance to morphine in dogs (preliminary report). I. H. PIERCE AND O. H. PLANT. *J. Pharmacol., Proc.* 31, 212(1927); cf. preceding abstracts.—Less than 30% of the morphine was recovered. When the dosage was high (50 mg. per kg.) only 2-8% was recovered. More was found in the urine than in the feces. GEORGE ERIC SIMPSON

Effect of ephedrine on intestinal contractions in unanesthetized dogs. J. H. KINNAMAN AND O. H. PLANT. *J. Pharmacol., Proc.* 31, 212-3(1927). G. E. S.

Further observations in experimental chronic morphinism. A. L. TATUM, K. H. COLLINS AND M. H. SEEVERS. *J. Pharmacol., Proc.* 31, 213-4(1927); cf. C. A. 20, 3042.—New expts. support the previously advanced view of addiction and tolerance. GEORGE ERIC SIMPSON

Effect of salicylates on the nitrogen metabolism. G. P. GRABFIELD AND EMILY KNAPP. *J. Pharmacol., Proc.* 31, 215-6(1927).—The increase in N elimination occurred immediately after Na salicylate was given, later after Li salicylate, and delayed after K salicylate. The Li salt caused an extremely prompt increase in uric acid excretion; with Na and K salts this occurred later. An increase in total S, chiefly due to inorg. SO_4 , paralleled the increase in N. GEORGE ERIC SIMPSON

The effect of sodium thiosulfate on arsenic elimination. A. G. YOUNG. *J. Pharmacol., Proc.* 31, 217(1927).—In 2 cases of As intoxication and 4 cases undergoing anti-syphilitic treatment but without intoxication, the excretion of As and urine vol. was followed for five days following 1 injection of neoarsphenamine. The following week $Na_2S_2O_3$ was given daily following the injection. In rabbits the effect of $Na_2S_2O_3$ in As poisoning on the excretion of As, duration of life, and the production of gross kidney lesions was detd. $Na_2S_2O_3$ decreased the rate of As excretion, and increased the

tolerance for repeated sublethal doses. With it, kidney lesions were less marked. The $\text{Na}_2\text{S}_2\text{O}_3$ may form an insol. compd. with As. GEORGE ERIC SIMPSON

The toxicity and trypanocidal activity in rats of a group of new unsymmetrical arseno compounds. W. K. STRATMAN-THOMAS AND A. S. LOEVENHART. *J. Pharmacol., Proc.* 31, 217-9 (1927).—The lethal dose, the max. tolerated dose and the dose which protected rats infected with *Trypanosoma brucei* were detd. for the following arsenobenzenes: *p*- $\text{HOOC}_6\text{H}_4\text{As}_2\text{C}_6\text{H}_4\text{NHCH}_2\text{CH}_2\text{OH}\cdot\text{HCl}\cdot\text{p}$, *p*- $\text{HOSOCH}_2\text{HNC}_6\text{H}_4\text{As}_2\text{C}_6\text{H}_4\text{NHCH}_2\text{CH}_2\text{OH}\cdot\text{p}$, 3,4- $\text{HCl}\cdot\text{H}_2\text{N}(\text{HO})\text{C}_6\text{H}_4\text{As}_2\text{C}_6\text{H}_4\text{NHCH}_2\text{CH}_2\text{OH}\cdot\text{HCl}\cdot\text{p}$, *p*- $\text{HOOC}_6\text{H}_4\text{As}_2\text{C}_6\text{H}_4\text{NHCH}_2\text{CONH}_2\cdot\text{HCl}\cdot\text{p}$, 3,4- $\text{HCl}\cdot\text{H}_2\text{N}(\text{HO})\text{C}_6\text{H}_4\text{As}_2\text{C}_6\text{H}_4\text{NHCH}_2\text{CONH}_2\cdot\text{HCl}\cdot\text{p}$.

GEORGE ERIC SIMPSON

The gaseous metabolism of the rain as influenced by various procedures, including certain drugs. C. F. SCHMIDT AND H. B. HAAG. *J. Pharmacol., Proc.* 31, 219-20 (1927); cf. *C. A.* 19, 1598.—Gaseous metabolism of the brain stem increased when respiration was stimulated, and decreased when it was depressed. Elec. stimulation, puncture of the medulla, morphine, atropine, caffeine, ether, ephedrine, adrenaline, and cyanides were used. CO_2 was also used. CO_2 usually decreased the apparent O_2 consumption and CO_2 production of the brain stem; this is perhaps because CO_2 dilates cerebral vessels markedly.

GEORGE ERIC SIMPSON

An application of the thermal conductivity method for the analysis of gases to pharmacological problems. B. H. ROBBINS AND P. D. LAMSON. *J. Pharmacol., Proc.* 31, 220 (1927).—The app. of Palmer and Weaver (*C. A.* 18, 1099) was applied to the detn. of CCl_4 in air.

GEORGE ERIC SIMPSON

The pharmacology of certain vasomotor reactions. D. E. JACKSON. *J. Pharmacol., Proc.* 31, 220-1 (1927).—Vaso-constriction in nasal mucous membranes and accessory nasal sinuses occurred when adrenaline, ephedrine, β -tetrahydronaphthylamine-HCl, pituitrin or Ba were injected into a femoral vein. Deep Et_2O or $\text{CH}=\text{CH}$ anesthesia, and CO_2 caused vaso-dilatation.

GEORGE ERIC SIMPSON

Excretion studies in experimental nephritis. ADOLPH BOLLIGER. *J. Pharmacol., Proc.* 31, 221-2 (1927).—After deep x-ray had produced chronic interstitial nephritis in dogs, phenolsulfonephthalein, acid fuchsin, Buffalo fast crimson, uranin, indigo carmin, $\text{Na}_2\text{S}_2\text{O}_3$ and Na_3PO_4 (?), injected intravenously, showed the same excretion curves. The NaI curve was irregular during different stages of the nephritis. The output of $\text{Na}_2\text{S}_2\text{O}_3$ and NaI was depressed during gestation. "Acid fuchsin, uranin, $\text{Na}_2\text{S}_2\text{O}_3$ and Na_3PO_4 (?) may indicate more definitely early kidney lesions than the phenolsulfonephthalein test."

GEORGE ERIC SIMPSON

Action of some expectorants. W. L. MENDENHALL AND MILDRED CATE. *J. Pharmacol., Proc.* 31, 222 (1927).—Weak concns. of expectorants applied to oyster cilia previously paralyzed with ACh in Et_2O stimulated markedly. NH_4Cl , HI and KI were depressant in higher concns.

GEORGE ERIC SIMPSON

Action of barium chloride. H. A. MCGUIGAN AND H. N. ETS. *J. Pharmacol., Proc.* 31, 223-4 (1927).—The results indicate that at least some of the toxicity of BaCl_2 placed in intestinal loops was due to the removal of Ca in the tissues. When BaS was spread on the ears of rabbits, sulfide, but not Ba, was found in the tissues of the animals, who died, probably from sulfide poisoning. CaS and K_2S were not as toxic as BaS .

GEORGE ERIC SIMPSON

Some observations on the pharmacology of tin. F. W. SCHWARTZ AND W. F. CLARKE. *J. Pharmacol., Proc.* 31, 224-5 (1927).—The amts. of Sn or Sn compds. fed to animals were not harmful. When men were fed 2 to 2.75 g. Sn in 5 days, only slight amts. of SnO were found in the urine.

Bromine excretion following bromoform anesthesia. G. H. W. LUCAS, W. E. BROWN AND V. E. HENDERSON. *J. Pharmacol., Proc.* 31, 225 (1927).—After anesthesia with CHBr_3 , $\text{C}_2\text{H}_5\text{Br}$ and $\text{CH}_2\text{Br}\cdot\text{CH}_2\text{Br}$, Br was excreted in the urine. G. E. S.

Myographic studies of picrotoxin convulsions. MCKEEN CATTELL. *J. Pharmacol., Proc.* 31, 227 (1927).

GEORGE ERIC SIMPSON

A clinical standardization of digitalis. I. F. MARTIN. *J. Pharmacol.* 31, 229-45 (1927); cf. following abstr.—Samples of digitalis prepd. by Magnus for the Hygiene Committee of the League of Nations were used in this work and in that reported in the following abstr. Each sample was used on 6 or 7 different cases of myocardial insufficiency. The criteria of clinical improvement included improved respiration, clearing of congested lung bases, diuresis, etc., as well as slowing of cardiac rate. The relative potencies were A 76%, B 141%, of C. Biol. assay in other labs. is reported as giving: A 62%, B 116%, of C (report on standardization of digitalis to Hygiene Committee of the League of Nations. E. KNAFFL-LENZ. Personal communication to Martin.)

GEORGE ERIC SIMPSON

The clinical comparison of three preparations of digitalis. A. R. GILCHRIST AND D. M. LYON. *J. Pharmacol.* 31, 319-32(1927); cf. preceding abstr.—The digitalis preps. were ostensibly the same as those used by Martin. They were given to 122 subjects, mostly fibrillators, but also to non-fibrillators and non-cardiac cases. With the 2 latter groups inconstant results were obtained. The criterion of therapeutic effect was slowing of the heart rate. The relative strengths as detd. with fibrillators were A 64%, B 89%, of C, which compares favorably with results obtained by Joachimglu. Biol. assay in other labs. is reported as giving: A 38-88, av. 60%; B 70-145, av. 100%, of C (Knaff-Lenz, *C. A.* 21, 301).

The effect of insulin on hypophysectomized dogs. F. M. K. GETLING, D. CAMPBELL AND Y. ISHIKAWA. *J. Pharmacol.* 31, 247-68(1927).—The hormone of the posterior lobe of the hypophysis is antagonistic to the action of insulin. This is shown by the following evidence: (a) Hypophysectomized dogs (2) showed an increased sensitivity to insulin. (b) This sensitivity increased progressively in the course of weeks after the operation, in 3 instances. (c) Dogs with the stalk either removed or constricted with a silver clip also exhibited this sensitivity. (d) When posterior lobe ext. was injected simultaneously with a quantity of insulin otherwise sufficient to produce convulsions in 2 hypophysectomized dogs, convulsions were not produced, although blood sugar decreased. (e) This effect was not exhibited by anterior lobe ext. nor, in a single expt. did increased sensitivity follow removal of the anterior lobe. "The exact mechanism of the antagonistic action of the pituitary gland and the thyroid to insulin is not clear." The progressively increasing sensitivity of hypophysectomized dogs is probably explained by the atrophy of some of the ductless glands whose hormones are antagonistic to insulin.

The anesthetic value of nitrous oxide under pressure. W. E. BROWN, G. H. W. LUCAS AND V. E. HENDERSON. *J. Pharmacol.* 31, 269-89(1927).—For producing anesthesia with N_2O , anoxemia is necessary. To show this, 20 expts. were performed with rabbits and cats, using mixts. of 5 to 21% O_2 in N_2O , at 1 to 2 atm. pressure. Anesthesia (i. e., lack of response to elec. stimulation) was produced only when the partial pressure of O was 70 mm. or less.

The electromotive action of drugs as a cause of their toxicity. I. The extension of Nernst's theory of excitation and the experimental demonstration of the sensitivity of a certain phase boundary potential towards potent alkaloids. R. BEUTNER. *J. Pharmacol.* 31, 305-18(1927).—The system $Hg|KCl|KCl$ in satd. $HgCl|10\%$ oleic acid in nitrobenzene $|0.02\%$ Na oleate in physiol. $NaCl|KCl$ in satd. $HgCl|Hg$ was set up. The oleate- $NaCl$ soln. was contained in a beaker; addn. of 0.2, 1.0, 2.0, 4.0 mg. pilocarpine per 100 cc. of this soln. caused a lowering of the e. m. f. of the system by 11, 33, 43 and 57 millivolts. Strychnine sulfate, cocaine-HCl, epinephrine and other drugs were used in similar expts. "A change of the p. d. is brought about also somewhere inside the tissues, resembling to some extent that in the artificial system."

The toxicity of drugs after hemorrhage. HARRY GOLD. *J. Pharmacol.* 31, 291-303 (1927).—"The diminished vol. of circulating fluid [produced by removal of 50% of the blood] is an important factor in the causation of increased susceptibility [of cats to strychnine, physostigmine, chloral hydrate and ouabain] not by reason of the greater concn. of the drug in the blood stream, but because the vol. of blood controls... the distribution of blood to various organs of the body." The increased susceptibility was found with all 4 drugs. Its possible cause was detd. by expts. with strychnine: (a) Normal tolerance may return in 2 hrs. with blood pressure still low. It returns simultaneously with partial restoration of blood vol. (b) Retaining normal blood pressure by means of epinephrine did not secure normal tolerance. (c) It was restored temporarily by replacing the blood with Locke's soln. (d) Reduction of the alk. reserve did not affect tolerance.

Action of domesticin-methyl ether upon the peripheral nerves. T. SHIINA. *J. Pharm. Soc. Japan* No. 544, 529-32(1927).—An answer to the criticism of S.'s work (*Z. med. Gesellsch. Chiba* 4, No. 5) by Takase and Ohashi (*C. A.* 21, 2336). NAO UYEH

Further observations on the anti-diabetic properties of Tecoma mollis. G. G. COLIN. *J. Am. Pharm. Assoc.* 16, 199-203(1927); cf. *C. A.* 21, 777.—After several trials with animals with artificial diabetes (phlorizin) it was concluded that the drug had no effect under those conditions. The drug is not toxic to animals. It may be used over a long period of time without harmful effects, in man. As a general tonic it may occupy a prominent place in rational therapeutics. Although its action has not been well defined, its effects are well proved. Seven diabetic patients were treated. In all cases thirst was diminished and consequently the 24-hr. vol. of urine decreased. In no case did the decrease in vol. of urine correspond to a proportionate rise in glucose

concn., diabetic factors remaining const. Some patients stated that they had felt aphrodisiac effects. These patients were over 60 yrs. of age, male. A remarkable increase in appetite was manifested by several patients (the ext. has an intensely bitter taste). One patient who had been under insulin treatment previously refused to continue the treatment, because the increase in appetite interfered with his dietetic habits. This effect is not permanent. It is felt only during 3 or 4 days at the beginning of the treatment. It is impossible to state in definite percentages the no. of those benefited and of the negative cases. Outside patients usually discontinue the treatment at the first signs of improvement. Although the glucosuria persists, the general health of the patient is improved. In a no. of cases the results were absolutely negative, in every respect. Although the use of *Tecoma mollis* benefits some types of diabetic patients, it has not been defined what types of diabetes it is best suited for. The fact that some old patients have felt aphrodisiac stimulation may point out its properties as a general tonic. It has been believed that *Tecoma mollis* is a diuretic, but facts seem to point to the contrary. The action of the drug is antidiuretic and it seems likely that there may be a possible stimulation to pituitary secretion by the use of the ext. L. E. WARREN

Some observations on digitalis action. ALBERT SCHNEIDER. *J. Am. Pharm. Assoc.* 16, 614-6(1927).—Each of 72 individuals was given 0.1 cc. of infusion of digitalis per kg. of body wt. and the pulse rate observed 30 min. later, and also at succeeding intervals of 10 min. for an hr. or more. In one series Ca lactate was also given. The results indicate that Ca increases and stabilizes digitalis action. Age modifies digitalis action. Persons with age ranges from 19 to 21 yrs. showed an av. pulse rate reduction of 11.4%, whereas those with an age range from 28 to 30 yrs. showed an av. reduction of 8.94%. Variation in body wt. apparently does not markedly modify pulse rate reduction due to digitalis action, at least not when the dosage is according to body wt. The av. % rate reduction for wts. from 135 to 160 lbs. was 9.3%. A small percentage of persons apparently show an increase in pulse rate following digitalis administration, even when combined with Ca. The limited no. of observations made would indicate that digitalis does not influence an irregular heart. The tests indicate that the pulse rate would serve as a guide to the therapeutic action of digitalis in cardiac cases, and also as a guide to dosage. Well dried and well kept digitalis leaf does not lose much more than 8-10% of its action within 1 yr. This has been verified in other samples of digitalis. However, badly kept and badly cured leaf loses its strength rapidly. A full strength infusion of digitalis leaf, when given in doses of 0.1 cc. per kg. of body wt., should cause an av. percentage reduction in pulse rate of 10. There is, however, considerable individual variation in the rate of reduction. L. E. WARREN

Further studies on the physiologic action of propylene. LLOYD K. RIGGS AND HAROLD D. GOULDEN. *J. Am. Pharm. Assoc.* 16, 635-9(1927).—Continuation (C. A. 19, 3122). The results tend to confirm the previous observation that the primary toxic action of propylene is upon the respiratory center and only secondarily on the heart. In one animal the respiration and heart failed simultaneously. Periods of muscular rigidity occurred in some of the animals accompanied by a contraction of the oculomotor muscles, thus causing a stare. Old, stored propylene caused these symptoms more frequently than the recently prepd. uncompressed anesthetic. L. E. WARREN

The influence of digitalis on the resistance of guinea pigs to poisoning by diphtheria toxin. C. C. HASKELL. *J. Am. Pharm. Assoc.* 16, 639-44(1927).—It has been stated that digitalis is contraindicated in diphtheria and other infections. In the expts. reported on, diphtheria was selected for the tests and it was found that the administration of tincture of digitalis, apparently, does not hasten the death of guinea pigs that were coincidentally given a dose of diphtheria toxin. L. E. WARREN

Influence of kidney irritants on the gaseous metabolism of kidney. HIRONORI KABURAKI. *Proc. Imp. Acad. (Japan)* 3, 474-5(1927).—Such kidney irritants as sandalwood oil and turpentine oil augment the O consumption by affecting the kidney cells, but this irritation does not necessarily accompany diuresis. C. J. WEST

Ethylene vs. nitrous oxide: A statistical study of the circulation. L. F. SISE. *Anesthesia and Analgesia* 6, 17-20(1927). R. C. WILLSON

The true anesthetic value of nitrous oxide. V. E. HENDERSON, W. EASON BROWN AND G. H. W. LUCAS. *Anesthesia and Analgesia* 6, 21-4(1927).—Rabbits were subjected to N₂O-O₂ mixts. under pressure. Contrary to Paul Bert, it was found that anesthesia (lack of response to elec. stimulation) was not produced as long as the O₂ concn. was as great as in air. R. C. WILLSON

Experiences with carbon dioxide in hiccough. R. F. SHELDON. *Anesthesia and Analgesia* 6, 31-34(1927). R. C. WILLSON

Propylene, ethylene, nitrous oxide and ether: Some comparative investigations. CHAPMAN REYNOLDS. *Anesthesia and Analgesia* 6, 121-4 (1927); cf. *C. A.* 20, 1870.—In mixts. in which the partial pressure due to propylene was 35% and that due to O₂ 20%, frog hearts *in situ* survived for an av. of 332 min. while in ethylene 90% and O₂ 20% mixts. the av. survival time was 287 min. Isolated turtle hearts which survived in air for an av. time of 272 min. survived (av.) for 205 and 225 min., resp., in propylene 35%-O₂ 20% and ethylene 90%-O₂ 20%. The min. anesthetic and minimal lethal concns. for white mice were, resp., propylene, 40 and 65% gas; ethylene, 90 and 146% gas; N₂O 90 and 270% gas. Electrocardiographic observations on dogs showed that propylene in concns. above 25% and below anesthetizing concns. caused ectopic ventricular contractions. Ectopics were not observed in control studies with ethylene, N₂O, Et₂O and CHCl₃. R. C. WILLSON

The effects of acetaldehyde, ether peroxide, ethyl mercaptan, ethyl sulfide and several ketones—dimethyl, ethylmethyl and diethyl—when added to anesthetic ether. WESLEY BOURNE. *Anesthesia and Analgesia* 6, 131-10 (1927); see *C. A.* 20, 3747. R. C. WILLSON

Further observations on the use of barbital as a preventative of cocaine toxicosis. JOHN LESHURE. *Anesthesia and Analgesia* 6, 189-90 (1927).—Doses of 0.4 to 0.8 g. of sodium barbital orally at least 30 min. before the induction of cocaine analgesia will prevent symptoms of cocaine toxicosis in practically every case. R. C. WILLSON

The duration of the life of the *Spirochaeta pallida* under the influence of bismuth treatment. S. V. SZENTKIRÁLYI. *Dermatol. Wochschr.* 84, 22-4 (1927).—The curve of the duration of life during neoarsphenamine treatment falls sharply in 24 hrs., while during Hg treatment days or even weeks are required before the curve reaches zero. The curve for neobismosalvan (iodine-quinine-bismuth 50%, lecithin 50%) falls slowly during the first 24 hrs. and sharply thereafter. R. C. WILLSON

The effect of neoarsphenamine on the formation of immune bodies. M. MELCZER AND O. DAHMEN. *Dermatol. Wochschr.* 84, 581-7 (1927).—Neoarsphenamine administered intravenously has only an etiotropic action. However, in cases of manifest syphilis with febrile reactions, the icetus immunisatorius plays a certain role. R. C. WILLSON

Two years' observation of the fundus oculi in tryparsamide treatment of general focal or paralysis of the insane. J. H. ROTH. *Ill. Med. J.* 51, 242-5 (1927). R. C. W.

Treatment of metallic poisoning with sodium thiosulfate. D. W. GOLDSTEIN. *J. Ark. Med. Soc.* 23, 133-4 (1927).—The use of Na₂S₂O₃ (0.6-1.0 g.) intravenously soon after the ingestion of the drug effected a rapid cure without the usual distressing symptoms in 4 cases of HgCl₂ poisoning, 1 of acute As poisoning and 1 of chronic As poisoning. R. C. WILLSON

Red urine. J. A. MEASE, JR. *J. Fla. Med. Assocn.* 13, 291-2 (1927).—Report of the case of a 5-year old child who after eating a large quantity of red beets (*Beta vulgaris*) excreted brilliant red urine. The abnormal color disappeared within 24 hrs. and was attributed to the anthocyanins in the beets. Subsequent feeding of a quantity of beets produced the same results. R. C. WILLSON

Relation of white snakeroot to human milk sickness. A. A. HANSEN. *J. Indiana State Med. Assocn.* 20, 182-7 (1927).—White snakeroot (*Eupatorium urticaefolium*) contains a complex alc. called *trematol*, a resinous acid and a volatile oil. Milk sickness in man is caused by the use of milk from cows which have grazed on white snakeroot. R. C. WILLSON

Five recent cases of shoe dye poisoning. HENRY ALBERT AND JAMES WALLACE. *J. Iowa State Med. Soc.* 17, 225-7 (1927).—In each case typical poisoning corresponding to that due to aniline or nitrobenzene developed soon after wearing shoes that had been dyed within 36 hrs. No fatal cases. R. C. WILLSON

The diuretic action of urea and high protein diets. S. E. KING. *Med. Clinics of N. Am.* 10, 963-78 (1927). R. C. WILLSON

Results of the long-continued use of insulin in diabetes. J. R. WILLIAMS. *N. Y. State J. Med.* 27, 49-50 (1927). R. C. WILLSON

Arsenic findings in dermatological conditions. BINFORD THORNE, L. S. VAN DYCK, ELEANOR MERPLES and C. N. MYERS. *N. Y. State J. of Med.* 27, 757-63 (1927).—Arsenic was found in pathol. amts. in the urine in eczema, scleroderma, leucoderma, psoriasis, Majocchi's disease, pemphigus, motor ocular paralysis and pigmentation.

In some cases of eczema it appears to be the exciting cause, producing symptoms immediately after contact; in other it appears to be deposited in the skin sensitizing it and causing a reaction when the person is exposed to a banal irritant. In scleroderma it appears that As attacks the vegetative nervous system and later perhaps the endocrine system. In a case of motor-ocular paralysis the As had combined with the SH radical of the nerve tissue, thus altering the nerve function. In leucoderma the affinity of As for pigment caused deposition in the pigmented region adjacent to the depigmented spots. It appears that food contamination and occupational contact are the most frequent sources of As poisoning.

R. C. WILLSON

Calcium metabolism and the parathyroid glands. C. F. DAVIDSON. *Northwest Med.* 26, 181-6(1927).—A review.

R. C. WILLSON

The use of insulin in the treatment of certain nondiabetic conditions of infancy and childhood. V. W. SPICKARD. *Northwest Med.* 26, 282-4(1927).—Insulin was found beneficial in alimentary intoxication, acidosis and acute infections with great dehydration.

R. C. WILLSON

A new iodine compound for cholecystography. B. R. KIRKLIN. *Radiology* 9, 205-8(1927).—Diiodoethyl ether of disalicylphthalein was prepd. to be used in place of tetrabromo- or tetraiodophenolphthalein in x-ray examn. of the gall bladder, since the latter sometimes causes nausea, vomiting and purging and shows poor absorption. Limited experience with the new compd. indicates superiority over the compds. formerly used, in that shadows of deeper density are produced and there is no nausea after ingestion of it. Slight purgative effects in a few cases were attributed to impurities in the prepn.

R. C. WILLSON

Ergot preparations. A. STOLL AND E. ROTHLIN. *Schweiz. med. Wochschr.* 57, 106-10(1927).—To ergotamine is due most of the sp. action of ergot. Ergotamine is important in view of its sp. action on the vegetative nervous system.

R. C. W.

The effects of certain drugs on the capillaries: atropine, eserine, sparteine, digitalis, caffeine and cucurbititrin. I. S. BARKSDALE. *Southern Med. and Surg.* 89, 27-32(1927).—Frogs were used as subjects, the capillaries of the tongue and in the web of the foot being examd. Atropine exerts a constricting effect on the capillaries. Eserine has the opposite effect, although its action is not so prolonged. Sparteine produces marked capillary constriction. Digitalis has more of a dilator than constrictor effect. Caffeine produces a marked, general capillary constriction. Cucurbititrin dilates the capillaries and lowers the intracapillary pressure.

R. C. WILLSON

The use of *o*-iodoxybenzoic acid in the treatment of chronic arthritis. A. G. YOUNG. *Wisconsin Med. J.* 26, 346-50(1927); cf. *C. A.* 20, 3043.—Favorable report passed on 43 cases.

R. C. WILLSON

Relationship between the structure and the biological action of the cardiac glucosides (JACOBS, HOFFMANN) 10.

I—ZOOLOGY

R. A. GORTNER

The electric charge and agglutination in the amebocytes of marine invertebrates. E. FAURÉ-FRÉMIET AND G. NICHATA. *Ann. physiol. physicochim. biol.* 3, 247-306(1927). **The effect of the concentration of hydrogen ions on the amebocytes of marine invertebrates.** *Ibid* 307-16.—The cell activity as judged by the absorption of O₂ in the amebocytes of the *Asterias rubens*, is only slightly lowered at p_H 4.0 from that at p_H 7.4. At lower values than 3.0 there is a rapid drop in O₂ absorption to the lower limit of 1.8, where absorption of O₂ may practically stop. The effect of p_H is independent of the cation, the same results being obtained with CaCl₂ as with NaCl solns. An irreversible and lethal effect on the physical state of the protoplasm is produced by a p_H of 2.2, which is called the point of denaturation. This point varies for different amebocytes. The cessation of absorption of O₂ at p_H 1.8 is probably caused by an irreversible change in state which the cytoplasm commences to undergo at p_H 2.2. Although this is irreversible and lethal, the amebocytes may absorb O₂ when placed in neutral saline soln. but at an abnormal rate. **The action of some cations on the amebocytes of marine invertebrates.** *Ibid* 317-32.—The normal content of H₂O in the amebocyte of the *Asterias rubens* suspended in lymph is 76.9%. It is increased somewhat in isotonic MgCl₂ solns. and more so in NaCl and CaCl₂ solns. while it is slightly decreased in LaCl₃ soln. at the same p_H . At a const. p_H the O₂ absorption is greater in normal or dild. lymph than in unbalanced salt solns. It is more greatly decreased by NaCl and MgCl₂ than by CaCl₂, while it remains at the normal value when LaCl₃ is added to NaCl. The differences in physical characteristics of the cytoplasm caused by the different cations are not attributed to the variations in H₂O content caused by these solns.

H. J. D., Jr.

Hydrogen cyanide as an effective vermin destroyer. M. KAISER. *Wiener Zehlin. Wochschr.* 40, 882-6(1927).—Directions and precautions are given in detail.

D. B. DILL

The distribution of nitrogen in the blood and urine of the turtle (*Chrysemys Pinta*). F. H. WILEY AND H. B. LEWIS. *Am. J. Physiol.* 81, 692-5(1927).—In 8 samples of blood urea N varied from 4.7 to 26.0 mg. per 100 cc., amino N from 11.1 to 15.9 mg.; uric acid N from 0.1 to 1.4 mg. and total non-protein N from 34.4 to 81.9 mg. In the urine, urea N constituted from 24.1 to 47.8% of the total; NH_4N from 0.8 to 21.7%; amino N from 3.8 to 8.2% and creatine N 5.5% (one detn.). The N metabolism of the turtle is intermediate between the reptiles of the arid regions and the mammals, since both urea and uric acid in considerable amts. are found in its urine.

J. F. LYMAN

The physiology of reproduction in birds. XXII. Blood fat, and phosphorus in the sexes and their variations in the reproductive cycle. O. RIDDLE AND FRANCES H. BURNS. *Am. J. Physiol.* 81, 711-24(1927); cf. *C. A.* 20, 2531.—During the ovulation cycle of female ring doves the alc.-ether sol. substances in the whole blood were increased to 35% above the normal or resting value. The P contained in the ext. was increased 59% above the normal value. Normal male ring doves had less blood fat (1.77 g. per 100 cc.) than normal females (2.02) in the resting stage.

J. F. LYMAN

The parathyroid hormone. F. T. JUNG. *Am. J. Physiol.* 82, 22-6(1927).—The slight but definite mitigation of symptoms in parathyroidectomized rats subsequent to the implantation of the parathyroid glands of cats and dogs indicates the existence of a parathyroid hormone which is not species-specific.

J. F. LYMAN

The rate of killing of cladocerans at higher temperatures. L. A. BROWN AND W. J. CROZIER. *J. Gen. Physiol.* 11, 25-36(1927).—The velocities of killing of *Daphnia pulex* and *Moina macrocopa* were studied in the temp. ranges, 32-37° and 40-47°, resp. The velocity of killing at these supranormal temps. adheres to the Arrhenius equation for relation to temp. Over certain ranges of temp. the relationship between log. velocity of killing and the reciprocal of the abs. temp. is linear. Thermal killing involves the coagulation of protein. Differences in the temp. characteristic for the thermal killing process in closely related forms may be suggestive in regard to the mechanism of heat denaturing of proteins. The temp. limits within which the relations are linear are also those in which critical temps. for protoplasmic organization occur.

C. H. R.

The nature of the equation for growth processes. L. A. BROWN. *J. Gen. Physiol.* 11, 37-42(1927).—"An analysis of the growth curves of a cladoceran (*Pseudosida bidentata*) for one adult instar at each of 2 temps. is made by comparing the apparent gains or losses in time when the animals are transferred from one of these temps. to the other during the course of the developmental period. Since the curves for the 2 temps. when brought together at their end point do not coincide, the equation used to describe growth must have at least 2 velocity consts. unequally affected by changes in temp."

C. H. R.

The influence of some physical and chemical conditions of water on mayfly larvæ (*Cloëon dipterum* L.). H. S. PRUTHI. *Bull. Entomol. Research* 17, 279-84(1927).—Although H-ion concn. is a factor of great importance in the life of *Cloëon*, the CO_2 pressure is of greater importance and probably will afford a reliable index of the suitability of H_2O as a habitat for aquatic insects. *Cloëon* larvæ, and presumably other true aquatic insects, can withstand concns. of O_2 as low as 1 cc. per l., but in nature the concn. seldom goes so low. The exptl. results are given in tables.

C. H. RICHARDSON

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Heat penetration in relation to pasteurization. M. A. JOSLYN. *Fruit Products J. and Am. Vinegar Ind.* 7, No. 2, 9-11(1927).

J. A. KENNEDY

The trend of modern food inspection. ARTHUR RIGBY. *Public Health J.* 18, 75-85(1927).—A general discussion of food inspection and of food poisoning, bacteriol. and chem. A bibliography of 19 references is included.

R. E. THOMPSON

The application of ultra-violet radiation to the investigation of food products. W. EKHARD. *Z. Spiritusind.* 50, 4(1927).—The application of radiation in the detection of adulteration in meats, eggs, milk and milk products, fats, flour, sugars, fruit juices and gums is discussed.

C. N. FREY

Determination of water in foods. K. J. HOLTAPPEL. *Pharm. Tijds. Nederland. Indie* 3, 247-61; *Chem. Zentr.* 1926, II, 1212.—The detn. of water in maize gives in the tropics incorrect results by every method which involves drying in air, even at 120°.

Distn. with xylene is the best method, in which with suitable app. difficulties arising from turbidity of the distillate are avoided. With the app. of Aufhäuser (*C. A.* 17, 2066) the reading is inexact, but this condition may be corrected by the use of more substance and by placing a spherical extension under the scale. In the xylene distn., dehydration is still more profound than by drying *in vacuo* at 100° with P_2O_5 . A greater advantage of the direct detn. is that the decompn. of the sugars as a function of time can be followed.

C. C. DAVIS

Food changes in an ice refrigerator and an electrically controlled refrigerator. VICTORIA CARLSSON. *Teachers College Record* 28, No. 7(reprint).—Milk, soups and other foods were kept for varying periods of time on the shelves of an ice refrigerator and an electrically controlled refrigerator and tested daily for changes in H-ion concn., bacterial count, taste and absorption of odor. All tests indicate less bacterial increase and more efficient food preservation in the electrically controlled refrigerator, probably because of a lower temp. and lower humidity in the refrigerator.

N. M. NAYLOR

The presence of formaldehyde in wood smoke and in smoked foodstuffs. E. H. CALLOW. *Analyst* 52, 391-5(1927).—Schryver's test for HCHO is shown to be sp. and to be given by wood smoke although not usually present in wood distillates prepd. out of contact with the air. Hams and bacons that have been smoked usually contain a little HCHO as shown by Schryver's test.

W. T. H.

Artificial coloring of alimentary pastes. B. KAYSER. *Pharm. Zentralh.* 68, 499-500(1927).—A discussion.

W. O. F.

Report of the milk products sub-committee on uniformity of analytical methods. A. MORE, *et al.* *Analyst* 52, 402-8(1927).—Official methods of analysis are given for the detn. of total solids and fat in condensed milk. The results of different chemists using these methods are shown.

W. T. H.

Graphical standardization of condensed milk products. W. V. PRICE. *J. Dairy Sci.* 10, 377-83(1927).—A description in detail, and an illustration of a graph worked out by P., for a simplified and short method of calcul. for the standardization of condensed milk products, from a mixt. of known amts. of raw materials.

J. C. JURRJEWS

Milk composition and energy. O. R. OVERMAN AND F. P. SANMANN. *Illinois Sta. Rept.* 1926, 91-2.—The energy value in cal. per qt. of milk F may be detd. within ± 12.22 cal. in 97% of the samples by use of the formula $F = 52.78A + 16.41B + 37.78D + 46.91E - 2.75C - 57.70$, when $A = \% \text{ fat}$, $B = \% \text{ protein}$, $C = \% \text{ sugar}$, $D = \% \text{ total solids}$ and $E = \text{sp. gr.}$. If only the $\% \text{ fat}$ is known, $F = 113.7334(A + 2.4404)$ should be used. The metabolizable energy may be expected to lie within ± 31.90 cal per qt. of the value obtained by the formula $F_m = 105.287(A + 2.4185)$. The true heats of combustion per g. of butter fat, milk protein, and milk sugar probably lie between the values of Abderhalden and Hammarsten and those found by Anderson.

A. L. MEHRING

The coagulation of milk. HENRI DE WAELE. *Ann. physiol. physicochim. biol.* 3, 113-20(1927).—Isoelec. casein is insol. but its salts of the alk. metals are sol. Casein of milk is a complex of Ca-casein-phosphate, the compn. of which depends on the p_H . From p_H 7.8 to 6.5 it is sol. but from 6.5 to 4 the amt. of Ca and also the soly. diminish progressively. Fats and lipoids do not change the soly. Rennet hastens the rate of coagulation where it is not very acid but it does not widen appreciably the zone in which coagulation can take place.

H. J. DEUEL, JR.

The souring of milk in an electric field and during thunderstorms. G. H. LEOPOLD. *Chem. Weekblad* 24, 438-9(1927).—An influence of an elec. field on the souring of milk has been sought. The potentials chosen were the same as those likely to occur during thunderstorms; the influence of a strong alternating field has also been studied. Nothing noteworthy has appeared in any of the cases investigated. It has been shown that potential differences which arise during thunderstorms, or during weather in which thunder is to be expected, have no influence on the souring of milk. An elec. field does not appear to affect the spontaneous movements of 2 kinds of bacteria brought into it.

J. C. JURRJEWS

Determination of the freshness of milk. G. INICHOFF. *Z. Untersuch. Lebensm.* 53, 435-9(1927).—The method of Morres is unsuitable for the detn. of the freshness of milk because of the variable results it gives with fresh milk and because it is influenced by many factors, such as pasteurization, freezing, preservatives, etc.

WILLIAM J. HUSA

Is the fat-free dry substance of milk of decisive significance for detection of watered milk? A. GRONOVER AND F. TÜRK. *Z. Untersuch. Lebensm.* 53, 520-4(1927).—The detn. of f.-p. lowering is of primary importance for detection of added water in milk.

WILLIAM J. HUSA

Experiments on obtaining correct average samples of milk. K. WEBER. *Z. Untersuch. Lebensm.* 53, 449-54(1927).—The expts. show the importance of thorough stirring in sampling milk from cans. WILLIAM J. HUSA

Determination of chlorine in milk. F. MAH AND W. LEPPER. *Z. Untersuch. Lebensm.* 53, 454-8(1927).—Dil. 50 cc. of milk to 400 cc. and add 40 cc. of a reagent which consists of 50 g. of phosphotungstic acid and 500 cc. of HNO_3 (sp. gr. 1.4) in H_2O to make 1 l. Shake, filter and titrate 100 cc. of filtrate by Volhard's method with addn. of ether. WILLIAM J. HUSA

The determination of small quantities of benzoic acid in milk, butter, margarine, meat and egg yolk. J. GROSSFELD. *Z. Untersuch. Lebensm.* 53, 467-83(1927).—In order to ext. BzOH from aq. soln. with ether, C_6H_6 , etc., previous complete removal of colloidal proteins is necessary. The removal of colloids may be brought about by distn. with steam, salting out, or by a soln. of $\text{K}_4\text{Fe}(\text{CN})_6$ and ZnSO_4 . A suitable colorimetric method for the detn. of small quantities of BzOH is based on reduction of BzOH in ammoniacal soln. by HONH_2 to red compds. WILLIAM J. HUSA

The polarimetric determination of sucrose in sweetened condensed milk. H. D. RICHMOND. *Analyst* 52, 525-6(1927).—Honegger (*C. A.* 21, 967) attributed to Revis and Payne a method which is really that proposed by Harrison. In fact, Honegger has practically gone back to the original procedure of Harrison which was modified somewhat by R. and P. The following suggestions are made for carrying out the method. (1) When dilg. the condensed milk, allow the soln. to stand at 60° for at least 30 min. (2) Then cool to 10° , add the acid $\text{Hg}(\text{NO}_3)_2$, mix and carry out the polarization test at as low a temp. as possible. (3) Use Harrison's method and formula. (4) The milk sugar results will be low as the pptn. is incomplete by $\text{Hg}(\text{NO}_3)_2$. Always treat the final filtrate with phosphotungstic acid and use the difference between the readings before and after this treatment as a correction for the initial polarization. W. T. H.

The cream plug, its causes and prevention. H. H. SOMMER AND K. M. ROYER. *J. Dairy Sci.* 10, 416-30(1927).—The cream plugs contain a high % of fat, and microscopic examn. shows that the fat has coalesced into irregular masses. The fundamental cause is the presence in the cream of large fat globules which will rise rapidly into a dense layer and coalesce, being most rapid at higher storage temp., because the serum through which the globules must rise is less viscous. The milk and cream should be handled therefore in such a manner, that partial churning is avoided, or if this is impossible, reducing the size of the fat globules by either emulsifying or homogenizing at low pressures. J. C. JURRJENS

The fat content of the milk of Flemish cows in Flanders. MARCEL PAGET. *Ann. chim. anal. chim. appl.* 9, 265(1927).—About 3.7-4.0% g. of fat was obtained in the milk. In some cases as little as 2.7% was obtained in the normal product from individual cows. W. T. H.

Variations in the proportion of solids-not-fat in milk. J. F. TOCHER. *Scottish J. Agr.* 10, 201-10(1927); cf. *C. A.* 21, 462.—The solid-not-fat content of 676 samples of milk from as many individual cows averaged 8.80%. The av. for milk from Ayrshire and Friesian cows was 8.75 and 8.62%, resp., and for other breeds 8.86%. The min. % for all breeds was 7.5 and the max. 10.75. The non-fatty solids in daily composite samples of milk from a herd of 24 cows varied from a min. of 8.4 to a max. of 9.7% during 39 days and the daily percentages fluctuated greatly. The % of non-fatty solids tended to decrease with increase in yield of milk and also with increase in age of the cow. Non-fatty solids tended to decrease to a min. at about 20 weeks after calving and then gradually increased. K. D. JACOB

Miscellaneous studies in the dairy division of the Illinois Station. M. H. CAMPBELL, M. J. PRUCHA AND J. M. BRANNON. *Illinois Sta. Rept.* 1926, 93-6.—A method for detg. the size of fat globules is given. The size of the fat globules in Holstein milk is smaller than in Guernsey milk. The protein edestin prepd. from cotton seed failed to increase the rate of milk secretion when fed at the rate of 5 ozs. per 1000 lbs. of live wt. of cow, although it is being sold for that purpose. Na and Ca hypochlorites and chloramine-T proved to be the best chem. sterilizers of those tried for dairy utensils. A soln. contg. 150 p. p. m. Cl should be used. The prepn. of acidophilus milk requires very careful control. Skim milk is twice pasteurized for 30 min. at 175°F ., cooled to 100°F ., and inoculated with 3% of its vol. of vigorous acidophilus culture. When the acidity is 0.5-0.6% it is cooled to 60°F . and enough cream to make the fat content 1% is added. Then 5-10% lactic starter is added and the milk is passed through a homogenizer and over a cooler. A. L. MEHRING

The refraction and lactose content of milk of different herds. G. SCHULZE. *Z.*

Untersuch. Lebensm. 53, 509-20(1927).—The refraction and lactose content of milk undergo corresponding fluctuations. The refraction gives sufficient indication of the lactose content. The refraction of evening milk averages higher than for morning milk. When there are 3 milkings a day the refraction is about the same for the noon and evening milk.

Gentian violet lactose peptone bile for the detection of *Bacillus coli* in milk. **MILDRD ADAMS KESSLER AND JOS. C. SWENARTON.** *J. Bact.* 14, 47-53(1927).—Gas in this medium is a positive indication of *B. coli* and, for practical purposes, needs no confirmation.

WILLIAM J. HUSA

JOHN T. MYERS

Concerning the addition of calcium chloride to milk for cheese making. **W. V. PRICE.** *J. Dairy Sci.* 10, 373-6(1927).—Expts. were conducted under carefully controlled conditions, which approx. com. methods of manuf. accompanied by careful and exact observations and measurements. The CaCl_2 stimulated the action of rennet to such an extent, that it was necessary to reduce the amt. of rennet added to the milk in the test vat to $\frac{1}{2}$ the amt. used in the check vat, while the coagulation was also more rapid in the former. The direct result of the influence of CaCl_2 on the rennet action was a faster and firmer coagulation and a more rapid loss of moisture after cutting. At the time of pressing, however, the moisture contents of the 2 lots were practically identical. The results of the scoring of the cheese do not prove definitely that the CaCl_2 has a harmful effect upon the quality of the cheese.

J. C. JURRIJENS

Increasing the yield of cheese by the addition of calcium chloride to milk. **GEORGES KNAYSI AND J. D. NELSON.** *J. Dairy Sci.* 10, 396-9(1927).—A certain increase in cheese was always secured when CaCl_2 was added to the milk previous to the addn. of rennet ext., the increase probably varying with the compn. of the milk, as well as with the amt. of CaCl_2 added. Anhyd. CaCl_2 should be used. There was not only an increase of 5% in cheese, but there is a saving of rennet ext., and there are possibilities of reducing the amt. of starter. The curd is more easy to handle and the cheese has probably a superior nutritive value due to a more complete pptn. of the P_2O_5 and the Ca, while there are yet no indications of an impairment of flavor or ripening qualities of the cheese. The authors feel justified in advocating a thorough trial of the use of CaCl_2 in cheese making.

J. C. JURRIJENS

Black spot in cheese. **R. H. LEITCH.** *Scottish J. Agr.* 10, 165-71(1927).—Black spot in com. cheese could not be traced to bacterial or enzymic origin nor to the presence of salts of Zn, Cu or Fe, but appeared to be due entirely to minute traces of Pb, 1-2 p. p. m. Com. and c. p. red lead, white lead, Pb paints, Pb acetate, Pb solder and incrustations on the interior of Pb water pipes, all produced black spot when added to cheese in minute traces. The principal source of Pb contamination in cheese making is probably the cheese vat itself, the Pb being derived from Pb paint used on the walls of the steam jacket and from solder used in joining the seams of the vat. Introduction of elemental S into the raw curd during the process of manuf. did not induce black spot but imparted a very undesirable odor and taste to the ripe cheese.

K. D. JACOB

Vacuum method extends cheese life. **J. M. SHERMAN.** *Glass Container* 6, No. 5, 18(1927).—Both cream cheese and cottage cheese when packed under high vacuum in glass jars retained their flavor, consistency and palatability after storage for a year below 50°F.

CARL R. FELLERS

The relation of the Manley and Reichert figures for butter analysis. **H. S. SHREWSBURY.** *Analyst* 52, 388-90(1927).—The Manley figure gives an approximation to the Reichert-Meißl value if the equation $R = 100M/84.16$ is used, in which R designates the Reichert-Meißl value and M the Manley figure. The explanation of the discrepancy does not appear to be that given by Manley (*C. A.* 21, 1853).

W. T. H.

Great industrial chemical plants. A visit to the van den Bergh plant at Villastellone. **A. CHIAROTTINO.** *Notiz. chim.-ind.* 2, 427-8(1927).—An illustrated description of the manuf. of artificial butter.

C. C. DAVIS

Butter composition control. **W. F. JONES.** *World's Butter Rev.* 1, No. 1, 17-9(1927).—A description in detail of a method of mfg. butter that permits of controlling the compn., without injuring the workmanship of the butter.

J. C. JURRIJENS

The hydrogen-ion concentration of cold-storage butter. **E. H. PARFITT.** *World's Butter Rev.* 1, No. 3, 11-5(1927).—The av. H-ion concn. of butter increased during storage from p_H 6.13 to 6.43. As the score decreased, excepting scores over 94 and under 89, the p_H decreased. Butters showing a high no. of proteolytic type organisms showed greater increase in p_H during storage than those with a low no. The p_H of butters criticized for alk. flavor was on the acid side, but the increase in p_H during storage was 1.03. Butters in which starters were used showed the least variation in p_H during storage.

J. C. JURRIJENS

Mold and yeast counts and their relation to the composition of butter. H. MACY. *J. Dairy Sci.* 10, 384-95(1927).—Mold and yeast counts of 2700 samples of butter are given as well as the compn. Apparently the moisture content of the butter had no particular relationship to the counts. The mold and yeast counts are compared with the concn. of moisture, salt and "salt in brine." The salt content of the butter had a marked effect on both counts. The % of "salt in brine" seemed to show an effect upon the mold and yeast counts. The influence of higher concns. of salt and "salt in brine" appeared more marked for mold than for yeast counts. J. C. J.

The neutralization of cream for buttermaking. H. A. BENDIXEN. *World's Butter Rev.* 1, No. 3, 5-9(1927).—A discussion in detail of the use of different kinds of neutralizers as used in the creamery, and how to use them. J. C. JURJENS

The composition of bran and pollard: means for distinguishing quality. L. D. FOSTER. *New Zealand J. Agr.* 35, 19-22(1927).—Twelve samples each of bran and pollard, sepd. from pure local varieties of wheat in an exptl. mill, were analyzed. The av. results were H₂O 12.11 and 12.16, protein 13.55 and 15.21, fiber 10.68 and 4.65, ash 5.00 and 3.29, oil 3.70 and 4.23, carbohydrates 58.31 and 60.78% for bran and pollard, resp. The results agreed closely with those obtained by Wood and Adie (C. A. 11, 2834) on samples of com. English brans and pollards. The pollards also resembled closely in compn. a series of good av. quality, com. pollards milled locally. The av. results showed a distinct difference between bran and pollards in protein, fiber, ash and carbohydrates. F. considers the differences to be significant enough to afford a means of distinguishing between fair av. quality and adulterated pollards. K. D. J.

Some observations on the washing of gluten from flour. D. W. KENT-JONES. *Analyst* 52, 439-43(1927).—The use of a special soln., such as that suggested by Dill and Alsberg, does not eliminate the errors inherent in the gluten detn. Personal differences in the manipulation of gluten and dough cause variations in results even when different operators are using the same method. Each individual, however, ought to be able to get consistent results so that the ratio between the N content of the flour and the dried gluten should be approx. const. W. T. H.

A numerical expression for the color of flour. D. W. KENT-JONES. *Analyst* 52, 443-52(1927).—The color of flour can be expressed by the tints given to 2 different solvents. The yellow color can be extd. by gasoline and detd. in a special form of colorimeter which is shown. This value gives what may be called the natural whiteness or the artificial bleach of the flour. The grade of the flour can be judged by the amt. of reddish brown pigment present, which presumably comes from oil and can be detd. in the same colorimeter after extn. with alk. methanol. W. T. H.

Estimation of fat content of flour and milling stocks. C. W. HERD. *Cereal Chemistry* 4, 370-6(1927).—Less fat is extd. by ether from completely dried flour and stocks than from moist or partly dried stocks. The lower fat content found in flour after drying is not due to loss in "steam distillation" as suggested. The discoloration of flour on drying is probably due to a change in the fat or assocd. material, but this change does not account for any gain in weight. Values for the refractive index of wheat oil are given. The change in the fat is probably not an oxidation, but possibly an internal alteration, the nature of which was not detd. L. H. BAILEY

Observations on the estimation of the neutralizing value of acid calcium phosphate. C. W. HERD. *Cereal Chemistry* 4, 347-69(1927).—A comparison is made between the electrometric and colorimetric titrations of 2 acid phosphate powders. It is shown that the normal cold titration is dependent upon the rate of addn. of the alkali and consequently is not satisfactory. The hot direct method suffers from the same disadvantage. In the hot inverse method, the colorimetric end point agrees with the electrometric inflection, if the following conditions are observed: thymol blue used as indicator, or a small quantity of phenolphthalein; the mixture is heated until equil. is reached. The result of this method gives a figure which is too high for com. practice, but is characteristic of that particular phosphate powder. Bailey's p_H method is useful for checking the correct mixt. of a raising powder and can, with advantage, be used to correlate the above titration figure with the most satisfactory acid phosphate: NaHCO₃ ratio for baking practice. The p_H of satisfactory baked scones is 6.55 to 6.85. L. H. BAILEY

Interpretation of baking tests. L. W. HAAS. *Cereal Chemistry* 4, 389-94(1927).—The important points to consider in judging a test loaf are: measured loaf vol., oven spring, shape, bloom, grain, texture, color of crumb, flavor and odor. A voluminous test loaf indicates a strong flour, providing that the oven spring, grain and texture are good. The oven spring or break is also a valuable indication of the strength of a flour. The break should be bold and shreddy and show no signs of shortness, tearing or splitting.

Lack of oven spring or a ragged break indicates a weak or possibly a green or freshly ground flour. A flour which produces bold, voluminous test loaves on both a long and a short fermentation indicates strength and good stability. When a short fermentation loaf appears to be gluten bound and a very long fermentation loaf shows good quality, unusual strength is indicated. Flours of this type are best used as sponge flours, or in hearth bread or in a blend with flours of lower strength. A pale sickly bloom indicates an over-bleached or otherwise damaged or defective flour. The grain should be close and uniform with thin-walled slightly elongated cells. An open grain may indicate a damaged flour, or it may show improper fermentation. The texture of the loaves should be smooth and silky. A clear, bright, creamy white color is by far the most desirable; dull gray is objectionable. Test loaves should be examd. for flavor and odor, any indications of mustiness or other foreign odors being noted. Unsound damaged or over-bleached flours usually have a characteristic "off" flavor and odor. Certain chem. data are of value in properly interpreting or checking the baking test. Among these are moisture, ash, protein and acidity, but the most important test is the baking test.

L. H. BAILEY

The role of phosphates in bread making. R. A. BARACKMAN AND C. H. BAILEY. *Cereal Chemistry* 4, 400-10(1927).—The authors' studies indicated that 0.2% and 0.4% of Ca acid phosphate increased the rate of CO₂ production. It has previously been indicated that such dosages of acid phosphate did not appreciably affect the rate of loss of gas from the dough. It accordingly followed that toward the close of the fermentation period the doughs contg. phosphate were larger in vol. than the non-phosphated doughs. Larger dosages of acid phosphate apparently tended to impair the gas-retaining capacity of the dough and thus to counteract the tendency toward a greater increase in expansion or vol. of the dough. Expts. were made which showed that there was no appreciable increase in the no. of yeast cells in the phosphated doughs over the non-phosphated ones but that there was greater activity of the cells in the production of alc. and gas.

L. H. BAILEY

Pre-harvest factors which affect wheat quality. C. F. MANGELS. *Cereal Chemistry* 4, 376-88(1927).—An attempt has been made to summarize the effect of the more important pre-harvest factors which affect the quality of wheat. These have been discussed in terms of test weight and protein content. For the sake of brevity no discussion of the effect of climatic and other factors on diastatic activity has been included, but data collected on North Dakota wheat indicate (Mangels 1926) that the diastatic activity of spring wheat tends to vary inversely as the protein content. The variation in diastatic activity may account for the relatively low baking strength of some lots of very high protein wheat. Pre-harvest factors affecting wheat quality invite further study. Certain factors are at least partially under the control of the grower, and further study of such factors should give the wheat producer a larger measure of control over the quality of the wheat produced.

L. H. BAILEY

Surveying the new wheat crop. R. C. SHERWOOD. *Cereal Chemistry* 4, 395-400 (1927).—Survey of the wheat crop immediately following harvest will provide valuable information concerning the character of the wheat prior to the movement to market in large quantities. Protein content, weight per measured bushel, and ash content are detns. which can be most readily utilized in a survey organized to obtain data concerning wheat quality. Lab. milling and baking tests of composite wheat samples are very useful when it is feasible to include them. Comparisons of protein content of Minnesota wheat as surveyed at harvest time and as marketed during the months following have shown close agreement for the crop years 1924, 1925 and 1926.

L. H. B.

The digestibility of wheat by-products. HARRY SNYDER. *The Northwestern Miller* 151, 923(1927).

L. H. BAILEY

Fruit jellies. V. The role of pectin. 1. The viscosity and jellying properties of pectin solutions. P. B. MYERS AND G. L. BAKER. *Univ. of Del. Agr. Expt. Sta. Bull.* 149 (1927); cf. C. A. 21, 3688.—The addn. of an acid or alkali to a pectin soln. at room temp. causes a drop in the viscosity of the soln. The decrease in viscosity with increase in acidity or p_H is negligible in comparison to the decrease in viscosity caused by the addn. of an alkali to the soln. or a decrease in its p_H . The max. viscosity of a pectin soln. occurs at the initial p_H of the soln. No indication of the isoelec. point of pectin is obtained through its viscosity measurements as Loeb has shown to be the case with proteins. Jelly strength is a function of the viscosity of the pectin soln. from which the jelly is made. This relationship is independent of the concn. of pectin. The sugar necessary to add to a pectin soln. to produce a jelly of given strength is dependent upon the viscosity of the pectin soln. Since the yield of jelly is dependent upon the amt. of sugar added and since the amt. of added sugar is dependent upon the

viscosity of the pectin soln., the viscosity of the soln. dets. the yield of jelly. The p_H at the optimum point of jelly formation varies with the concn. of pectin. The viscosity of a pectin soln. decreases rapidly as the time of boiling the soln. with acid is increased, the p_H and other factors remaining const. The % of pectic acid, detd. by the Wichmann method, is not an indication of the jellying power of the pectin. Reasons are given for doubting the accuracy of the modified Ca pectate method as a means of detg. the jellying power of a pectin. The method used for the pptn. of pectin with EtOH has an appreciable effect on the quality of the resulting pectin. Of the methods tried, running the EtOH into the pectin soln. dropwise, with const. stirring, produced the better quality pectin. Prolonged heating of a pectin soln. has a deleterious effect on the jellying power of the soln. The higher the temp. the greater the decrease in jellying power of the pectin. Boiling pectic substances with EtOH increases the % of H₂O-sol. pectin in the material. Boiling pectic substances or free pectin in EtOH decreases the jellying properties of the resulting pectin. A method is described for the prepn. of a high quality pectin. Contrary to the general belief, pectins obtained from pectic substances by extn. with distd. H₂O are not necessarily of a higher quality than those extd. by means of an acid soln. It is contended that pectins should be bought and sold on a basis of their jellying power.

CARL R. FELLERS

Jellies and jams made with and without an extracted pectin. VICTORIA CARLSSON. *Teachers College Record* 28, No. 8, (reprint) 11 pp.—The advantages of the use of an extd. pectin in the prepn. of jelly and jam are: jelly can be made with any available fruits, fully ripe or less mature, some of which naturally are deficient in jelly-making constituents; the time of cooking jelly or jam is shortened; the yield of jelly is increased and the cost per glass is reduced. The disadvantages of the use of an extd. pectin in prepn. of jelly and jam are: jellies tend to liquefy on standing; paraffin loosens from the edges of the glass; the jams are too firm and the pectin may impair natural fruit flavor; the jams cost more per glass.

N. M. NAYLOR

Sulfuring dried fruit. I. Apricots. W. R. JEWELL. *J. Dept. Agr. Victoria* 25, 457-62(1927).—The factors affecting the SO₂ content of dried apricots were studied in expts. carried out in com. sulfuring houses with full charges of fruit. Samples of the dried fruit were analyzed for SO₂ 5-6 weeks after sulfuring. Under accurately controlled conditions apricots could be more economically sulfured in air-tight houses than in loosely closed ones but in the latter a wider variation in the conditions of treatment was possible without leaving an excess of SO₂ in the fruit. The SO₂ content varied from 11.9 to 22.5 grains per lb. in fruit exposed for 4 to 15 hrs., resp., when S was burned at the rate of 8 lb. per ton of fruit in an air-tight house, and the SO₂ content varied with the amt. of S burned when the period of exposure was const. The SO₂ content of the dried fruit also varied directly as the H₂O content of the fresh fruit. The results of the expts. indicated that in order not to exceed a max. SO₂ content of 14 grains per lb. of finished product the amt. of S burned should be limited to 8 lb. per ton and the time of exposure should not exceed 4 to 5 hrs. during the day or 12 to 14 hrs., at night when the sulfuring is done in a loosely closed house. In tightly closed houses for day sulfuring 7 lb. of S per ton of fruit with 5 hrs.' exposure is recommended and for night sulfuring 5 lb. per ton with 12 hrs.' exposure.

K. D. JACOB

"Mikrobin" (sodium *p*-chlorobenzoate). C. VON DER HEIDE AND R. FÖLLEN. *Z. Untersuch. Lebensm.* 53, 487-509(1927); cf. *C. A.* 20, 2884.—*p*-Chlorobenzoic acid (I) is detected by a modification of Mohler's method for the detection of BzOH; the acids are differentiated by the behavior of their nitro derivs. with HONH₂. I is detd. as AgCl. Extensive data are given on the soly. of I and its Na salt in H₂O, alc., fruit juices and wines. I checks the growth of yeasts better than BzOH or salicylic acid but is inferior to BzOH against molds.

WILLIAM J. HUSA

The determination of sulfur dioxide in dried fruit. PERCY MAY. *Analyst* 52, 526(1927).—Miller's method (*C. A.* 21, 2743) should be of value as a quick sorting process but if the amt. is near the prescribed limit, the detn. should be repeated, using considerable acid with a reflux condenser or using a gravimetric method as previously recommended by Monier-Williams (*C. A.* 21, 2510). Cf. *C. A.* 21, 2742. W. T. H.

The utilization of the excess potato crop in America. K. BIERLING. *Z. Spiritusind.* 50, 211(1927).—Addn. of potato flour to wheat flour has been recommended. McCollum has shown that cereal proteins are improved by the addn. of potato protein. Hind-hede found potato protein a valuable food. The industrial utilization of potatoes is very little developed. Germany might utilize more potatoes for food and refrain from importing wheat.

C. N. FREY

The determination of the starch content of potatoes. W. EKHARD. *Z. Spiritusind.* 50, 271(1927).—The methods of Reimann and of Parow were compared and found to

check very well for sound potatoes, but with wet, decayed potatoes the Parow method gave results somewhat too high. C. N. FREY

Determination of sugar in chocolate. WILHELM MÜLLER. *Mitt. Lebensm. Hyg.* 18, 296-9(1927).—A comparison of the methods for sugar as given in Schweiz, Lebensmittelbuch 3, (1917) indicates that of these, the most reliable and const. results are obtained with the *sugar method of von Fellenberg*. RUSSELL C. ERB

The natural occurrence of boron compounds in cacao and cacao products. A. S. DODD. *Analyst* 52, 459-66(1927).—In ordinary chocolate there is a normal content of B equiv. to 0.01% of H_3BO_3 . Cacao beans and cocoa contain 0.02-0.08% H_3BO_3 . Similarly, coffee beans contain about 0.01% of H_3BO_3 . In Thomson's method for detg. boric acid, the use of *Sofnol Indicator* No. 1 is advised in place of methyl orange. W. T. H.

The microscopic determination of shell content of cacao powders. RICHARD TURNAU. *Z. Untersuch. Lebensm.* 53, 483 6(1927).—Expts. on the detection of shells in cacao products by counting the stone cells are described. WILLIAM J. HUSA

Fermentation and the preparation of cocoa. M. PORTERES. *Rev. botan. appl. agr. colon.* 7, 36-47(1927).—Results are given of expts. in the technic of cocoa prepn. M. S. ANDERSON

The "Indian tea fungus." F. DINSLAGE AND W. LUDORFF. *Z. Untersuch. Lebensm.* 53, 458-67(1927).—The "Indian tea fungus" causes fermentation in a tea infusion sweetened with sucrose, yielding a beverage contg. alc., HOAc and lactic acid in addn. to compds. which give an aroma. The supposed medicinal value of this beverage may be attributed to its laxative action. WILLIAM J. HUSA

Boric acid in coffee. WM. PARTRIDGE. *Analyst* 52, 401(1927).—In all of 31 samples of coffee examd. during the last 2 years from 6 different countries, the turmeric test for H_3BO_3 was obtained although there is no mention of this acid being used in coffee culture either in English or French literature. W. T. H.

Siena coffee. Results of chemical analyses. (MISS) ERSILIA CARLI. *Notiz. chim.-ind.* 2, 507-8(1927).—Beans from plants of the *Coffea arabica* which had been cultivated in Siena and had flourished extremely well were analyzed in comparison with colonial coffee. The data give the % compn. of the Siena and the colonial coffee, resp.: water, 10.34, 10.2-10.7; caffeine, 0.81, 0.9 1.1; fats, 11.36, 11.8 12.2; ash, 3.9, 3.1-5.3; aq. ext., 24.2, 28.31; reducing sugars, 6.3, 7.6 11.8. The analyses show that coffee may be cultivated away from the tropics and still form caffeine in almost normal quantity. C. C. DAVIS

Grading of carbonated beverages. J. H. BUCHANAN, E. E. PETERSON, J. H. TOULOUSE AND MAX LEVINE. *Glass Container* 6, No. 10, 13 36(1927).—A detailed discussion of scoring carbonated beverages is given. The following grading system is suggested: appearance, 25 points; taste, 25; food value, 25; absence of organisms, 8; gas vol., 7; acidity, 5; freedom from preservatives, 5. The 25 points allotted for "appearance" are made up as follows: fill, 1; color, 7; freedom from sediment and turbidities, 15; and freedom from emulsion break, 2. CARL R. FELLERS

The value of lactic acid in the preservation of mayonnaise dressing and other products. MIRIAM S. ISZARD. *Glass Container* 6, No. 4, 16 (1927).—Lactic acid treatment of mayonnaise and salad dressings seems to be a feasible method of arresting bacterial spoilage; first, because this acid is not harmful from a health point of view, and secondly, because the amt. necessary to use does not alter the taste as would vinegar were it employed in sufficient amts. to arrest bacterial development. Acidity of 1.75% lactic acid was the least amt. necessary to prevent deterioration of the product over a period of 5 months. CARL R. FELLERS

Some effects of freezing on onions. R. C. WRIGHT. *U. S. Dept. Agr. Dept. Circ.* 415, 1-8(1927).—The av. f. p. of onions of the globe type is 30°F. though the f. p. varies with the temp. at which they are held in storage. Onions may undercool below their f. p. without freezing; thus freezing does not always follow exposure to low temps. They should not be moved or handled roughly when cooled to temps. below their f. p. for if undercooled and so handled they are likely to freeze immediately. Freezing injury is easily confused with the results of physiol. breakdown. Onions with only the outermost scales injured by freezing may, as a rule, be salvaged if allowed to dry out. CARL R. FELLERS

The effect of common salt on lime water used for egg preserving. JAMES MILLER. *Analyst* 52, 457-8(1927).—Often NaCl is added to lime water used for preserving eggs but expts. show that whereas the addn. of a little NaCl does no harm, this is not the case when considerable NaCl is used. W. T. H.

Food values of New Zealand fish. VIII. Stewart Island oysters. JOHN MAL-

COLM. *Trans. Proc. New Zealand Inst.* 58, 167-73 (1927); cf. C. A. 20, 3754.—The oysters examd. all showed the presence of vitamin A when tested on rats that were supplied with the antirachitic factor. Dried oysters contained vitamin A in smaller equiv. quantities than fresh oysters. Dehydration of the food material by plaster of Paris followed by ether percolation gave much better results than ordinary drying of the material followed by Soxhlet extn. with ether. There is a loss of food value of the oyster in the process of spawning. The proportion of total N that exists in the non-protein form in the oyster is relatively large.

I. W. RIGGS

Annual report of 1924 of the experimental station for the canning industry. H. SERGER AND H. KIRCHHOF. *Konserven-Ind.* 13, 332-3, 351-5, 363-4, 374-6; *Chem. Zentr.* 1926, II, 2125.—White points in the jelly of some samples of "herrings in jelly" were identified as colonies of bacteria. *Sea salmon* of an abnormally intense red color became normally red when treated with EtOH or with 3% aq. NaCl. *Canned crabs* contained 0.21-0.44% H_3BO_3 . *Pickles* contained at the most 2.5% acid, and were preserved with H_2O_2 . *Segeberger salt* was only NaCl. The removal of difficultly sol. glycerides by cold crystn. from a sample of *nutrient beef fat* rendered it unattractive in appearance. "Dioxon" (H_2O_2) had a distinct preservative effect on sour pickled vegetables, but bleaches them and alters their flavor. "Microbin" and "Servin" can always be detected in small quantities. *Servin*, which contains 5.9% acids as AcOH and 0.7% HCO_2H , permits shorter heating in the canning of fruits and vegetables. The process by which EtOH is burned on the surface of the material to be preserved to sterilize the surface of the latter and at the same time to seal automatically the glass container is not so reliable as the ordinary boiling process. Six samples of *benzoate* contained 33.02-81.50% BzOH.

C. C. DAVIS

The behavior of the anthocyan pigments in canning. C. W. CULPEPPER AND J. S. CALDWELL. *J. Agr. Research* 35, 107-32 (1927).—The discoloration of fruits and vegetables canned in Sn is due to the reaction of the anthocyan pigments present with Sn dissolved from the container and results in the formation of complex metallic compds. of anthocyan which are violet in color. The quantity of violet compd. formed is detd. by the amt. of pigment present and by the degree of acidity in the medium, low acidity favoring its formation and high acidity depressing it. The anthocyan of the peach has been isolated and partially purified. Its behavior toward metals is similar to that of other anthocyan pigments. Anthocyan plays an important role in causation of corrosion and perforation wherever it is present. This occurs for the reason that the metal salts formed by combination of the acids of the fruit with the can metal are broken up by transfer of the metal into combination with the pigment releasing the acid to continue attack upon the can. An enameled can preserves the original color of red fruits and reduces discoloration by decreasing the contact between pigment and metal, but it increases the rapidity with which perforations of the metal occur by limiting the area from which metal can be removed.

W. H. ROSS

Temperature in bottles after filling with hot catsup. S. H. AYERS AND A. G. OSBORNE. *Glass Container* 6, No. 3, 5-10; No. 4, 5-42 (1927).—Fermentation and spoilage troubles in bottled catsup prompted this investigation. Thermocouples were used to measure temps. within the bottle. Wide variations in temp. exist at different points within the container. The temp. in the center of the catsup was nearest the filling temp.; at other points it fell below the filling temp. The differences in temp. in a given container vary with the temp. of the container when it is filled with hot catsup. In commercially filled catsup bottles the temp. on the inner surface of the cap never reaches a point high enough to have pasteurizing value. This is true regardless of whether the container is upright or on its side. A short heat treatment for hot-filled bottled catsup after capping is effective in raising the temp. sufficiently to prevent spoilage. Catsup should be filled at temps. above $170^{\circ}F$. capped and processed for at least 5 min. at $190^{\circ}F$.

CARL R. FELLERS

An automatic caustic testing apparatus for control of detergent solutions in bottle washing. M. E. PARKER. *Glass Container* 6, No. 3, 20-46 (1927).—The active germicidal and cleansing properties of detergent solns. are detd. to a considerable degree by their caustic concns. (NaOH). The use of hydrometers or titration with phenolphthalein alone was found unreliable. The Warder method (cf. Treadwell-Hall, *Analytical Chemistry—Quantitative*, Vol. 2, 564 (1916)) was found best for the detn. of alkali carbonate and hydroxide in the presence of each other. The special feature of the *automatic caustic testing app.* designed to use the Warder method is a double-scale buret calibrated to give directly the % of the 2 alkalies in detergent solns. Inexperienced persons are able to operate the app. with accuracy.

CARL R. FELLERS

Feeds for dairy cattle. W. B. NEVENS. *Illinois Sta. Rept.* 1926, 90-1.—Dairy

cows eating a liberal amt. of legume hay showed no desire for CaO in the form of finely ground limestone to which they had free access. Corn contg. 25-35% dry matter at the time of harvest made silage with better keeping qualities and higher feeding values than varieties not coming within these limits. The digestion coeffs. of silage made from 3 varieties of corn are given in tabular form. Cows on high-protein rations give less milk.

A. L. MEHRING

Specific and poisonous properties of feeding stuffs. J. ALAN MURRAY. *Fertiliser, Feeding-Stuffs and Farm Supplies J.* 12, 645-7(1927).—The specific and poisonous properties of plants and feeding stuffs are discussed with reference to their effect on animals.

K. D. JACOB

A technical study of the digestibility of corn-stover silage for beef cows. T. S. HAMILTON AND H. P. RUSK. Univ. Illinois, *Bull.* No. 291, 467-84(1927).—Digestion expts. with 8 beef-type cows showed the av. coeffs. of digestibility of corn-stover silage to be as follows: dry protein, 38%; N-free ext., 56%; crude fiber, 67%; ether ext., 59%. There are about 85% as much total digestible nutrients in stover silage as in the same wt. of whole-corn silage. However, exptl. feeding trials indicate that in practical feeding, stover silage is only about $\frac{2}{3}$ as valuable as normal silage. No considerable change in chem. compn. is brought about by ensiling corn stover, and there is little change in availability in the ruminants. The value of ensiling stover lies chiefly in its increased palatability and in smaller waste in feeding. The metabolizable energy of corn-stover silage varied from 1.35 to 1.71 therms per lb. with an av. of 1.57 for the 8 cows.

M. S. ANDERSON

A comparative investigation of the acid content of ensilage by Wiegner's method and the determination of the hydrogen-ion concentration. K. NEHRING. *Z. angew. Chem.* 40, 1058-60(1927).—In Wiegner's method for examg. ensilage, free and combined volatile fatty acids are detd. by distg. with steam, and lactic acid is detd. by direct titration of the aq. ext. N. substitutes detn. of the p_H value, and confirms Behren's results (*C. A.* 21, 1318). In making ensilage the fermentation is conducted so as to make lactic acid and not acetic and butyric acids. With a p_H of 4.25 or lower ensilage is free from butyric acid. With p_H to 4.75 only small quantities of butyric acid are present, but acetic acid has made its appearance. If p_H is above 4.80 butyric acid is always present, indicating poor ensilage. The detn. of p_H , therefore, gives a rapid and accurate method for detg. the value of ensilage, that with a value below 4.5 being considered good, that from 4.5 to 4.7 as fair to good, and that over 4.8 as bad.

W. C. EBAUGH

The purification of corn-starch sirup by means of Norit (BARTLING) 28. The determination of moisture by the volatile solvent method (JONES, McLACHLAN) 7. The relation of maturity of California plums to shipping and dessert quality (ALEN, *et al.*) 11D. The non-protein N in certain dairy rations and the partition of N in the urine produced thereon (KRAUSS) 11E. The tannin cells in the fruit pulp of different varieties of *Diospyros* (GRIEBEL) 11D. Examination of halophilic microorganisms (CLAYTON, GIBBS) 11C. Seasonal variations in the carbohydrate content of swedes (CALDWELL) 11D. Co(SCN)₂, as a microchemical reagent [in the examination of flours and foodstuffs] (GREGER) 7. The use of hypochlorites as a sterilizing agent for dairy utensils (HOY RENNIE) 11C.

Food mixtures. A. LEO. U. S. 1,643,950, Oct. 4. A compn. for use in making meringues, marshmallows, etc., is formed with albumin and pectin. U. S. 1,643,951 specifies the use together of albumin, pectin, NaHCO₃ and citric acid.

Treating flour, etc. E. STAUDT. Can. 274,290, Sept. 27, 1927. Ground products, such as flours, are treated, to shorten the maturing process and improve their baking qualities, with a mixt. of gaseous ClO₂ and an inactive gas to obtain the necessary low concn.

Cereal food product (bread). F. MATZELLE. U. S. 1,643,507, Sept. 27. Bread of texture similar to that of ordinary white bread is prepd. by a specified formula, in which gluten flour and buckwheat flour are used together with other ingredients such as those usually employed for making white wheat bread.

Vitamins. A. W. OWE. Can. 273,982, Sept. 20, 1927. Fats contg. fat-sol. vitamins are sapond. and an edible fat is added to the sapon. product so as to dissolve the fat-sol. vitamin. The resulting vitaminized fat is sepd. from undissolved matter.

Conditioning dried fruit. SUN-MAID RAISIN GROWERS OF CALIFORNIA. Brit. 262,983, Feb. 16, 1926. Raisins, currants, figs, prunes or other dried fruits are treated by passage, with agitation, through a zone of intense heat at such a speed that the

duration of the treatment is so short that injurious scorching of the fruit is avoided. Oil extd. from raisin seeds or other oil may be atomized and sprayed on raisins in a cooling device. Brit. 262,989–90 specify app. for carrying out this or similar processes.

Preserving egg contents. H. F. ZOLLER. U. S. 1,643,913, Sept. 27. Raw egg material is mixed with $1\frac{1}{2}$ –2% of ethylene glycol and the mixt. is frozen.

Butter. S. KARPINSKY and J. S. ANDERSON. U. S. 1,644,254, Oct. 4. Cream previously charged with air is passed through a series of fine interstices in close succession and in an extremely sinuous path. An app. is described. Cf. C. A. 20, 1476.

Butter. G. A. GRAY and M. B. NEWBURGER. U. S. 1,643,301, Sept. 27. SO_2 is added to cream prior to shipment, the SO_2 is oxidized by the use of H_2O_2 after shipment, and the cream is then fermented and churned into butter.

Purifying milk and milk products. MARGARET B. MACDONALD. U. S. 1,644,842, Oct. 11. Foreign odors and flavors are removed by mixing with a mineral oil, e. g., a refined paraffin oil, and then sepgg. the oil.

Pasteurizing apparatus with cooler and separator. AKTIEBOLAGET SEPARATOR. Swed. 63,240, June 28, 1927.

Apparatus for producing smoke for curing meats, etc. H. M. ROBERTSON. U. S. 1,644,693, Oct. 11.

Food for animals. S. M. CORBETT. Brit. 263,047, June 29, 1926. After pressing out the juice from pineapple "shells," cores, trimmings and ends, the residue is thoroughly dried at a temp. above the b. p. and may be pulverized and used alone as a food or mixed with other ingredients such as wheat middlings, coconut or cottonseed meal or tannage.

Cattle food. A. BU. Brit. 263,014, April 26, 1926. Molasses or treacle is mixed with herring or other fish, seal or whale meat or with their waste products. H_2O may first be pressed out of the raw material after finely dividing it.

Treating molasses for use in stock foods. J. H. LEFTWICH. U. S. 1,643,666, Sept. 27. Low grade or final by-product molasses is mixed with decolorizing C which is allowed to remain with the molasses to prevent undesirable discoloration of composite stock foods in which the molasses is associated with other ingredients.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Japan as a market for chemicals. WALTER BUCHLER. *Ind. Chemist* 3, 383–4 (1927). E. J. C.

New syntheses in the solvent industry. VOSS. *Kunststoffe* 17, 79–80, 132–4, 205–7 (1927).—Recent patents are reviewed on processes dealing with the generation of MeOH from water gas, direct oxidation of CH_4 to MeOH, manuf. of MeCl and MeBr from CH_4 and the oxidation of these to MeOH and the manuf. of MeOH from CO. D. THURSEN

The recovery of volatile solvents by chemical washing. HEINRICH WIESENTHAL. *Chem.-Ztg.* 51, 373 (1927).—The app. made by the Cheminova (German) firm, for the recovery of alc. and ether from *artificial-silk processes*, is described briefly. Vapor-contg. air is filtered to remove dust and then passed through several scrubbing towers. The resulting liquid is then fractionally distld. J. H. PERRY

Emulsifying medium. G. M. WILLIAMS. *J. Soc. Dyers Colorists* 43, 296 (1927).—The medium employed is known as Amoa, and is the product of the action of KOH on pure casein under the influence of heat, among other substances, polypeptides being formed. The applications of Amoa to the making of emulsions of a large variety of substances are described. L. W. RIGGS

The trickling condenser. J. HUBER. *Arch. Wärmewirt.* 8, 75–9 (1927).—A detailed elementary mathematical discussion of trickling condensers for refrigerating plants. ERNEST W. THIBLE

High-pressure oxygen and nitrogen plants of small power consumption. V. FISCHER. *Z. Ver. deut. Ing.* 71, 1059–63 (1927).—Theoretical calcns. are made on the small-scale sepn. of O_2 and N_2 from air, using a 3-stage air compressor, a N cycle, a precooler and an expansion engine. Considerable exptl. data are given on the practical operation of such a small unit. J. H. PERRY

Technical aerosols and their properties. P. BEYERSDORFER. *Kolloid-Z.* 42, 229–33 (1927).—The complex problems of dust explosions are omitted in this discussion. Any combustible dust brought into the sol. condition is explosive while an aerogel must

first pass into the sol. condition. Studies were made of S and sugar mixts. and of air, carbon dust and CH_4 . Problems in metallurgy, dust precipitators, refractories, blast-furnace gas, coal-tar vapor and many others are briefly mentioned. Combustion in motors and reclamation of aerosols and further industrial problems are described.

R. H. L.

Slide rule for pipe computations. H. BEHRENS. *Gas u. Wasserfach* 70, 905-10, 930-2(1927).—A slide rule is described which facilitates the computation of pipe sizes, friction losses, etc., for water, steam, air and gas.

R. W. RYAN

Heat transfer in the condensation of saturated and superheated steam. H. CLAASSEN. *Centr. Zuckerind* 35, 129-217(1927).—STENDER. *Ibid* 190-1. SCHIEDD. *Ibid* 218. DELVENE. *Ibid* 218 9(1927).—Polemic.

W. L. BADGER

Heat transfer in furnaces with ceramic muffles. H. REPKY. *Arch. Warmewirt.* 8, 101-5(1927).—A method of calcn. is discussed in detail.

ERNEST W. THIBLE

Waste heat utilization. CHAS. F. WADE. *Brit. Clayworker* 36, 163-5(1927).—The subjects covered are (1) sources of waste heat; (2) conditions for max. economy; (3) engine adjustments; (4) utilization of surplus exhaust; (5) reducing steam consumption; (6) application of hot air in the brick industry.

R. A. HEINDL

Heat transmission by radiation from non-luminous gases. H. C. HOTTEL. *Ind. Eng. Chem.* 19, 888-94(1927).—The radiation from CO_2 and H_2O at different temps. is plotted, and consts. are derived for the absorption from these gases by various phys. arrangements of the cold body. The results are arranged in charts which make possible actual calcns. for specific boiler or furnace construction. Illustrative problems are solved, but the data cannot be assembled in an abstr.

W. L. BADGER

Conductivity methods of measuring condenser leakage. H. C. PARKER AND W. N. GREEK. *Power* 66, 476-81(1927).—The conductance of a condensed steam sample, of the condensate and of a 1% soln. of circulating water suffice to det. the rate of condenser leakage. The app. necessary for these measurements is described.

D. B. D.

Periodical report on war gases. A. KONOWALOW. *Z. ges. Schiess-Sprengstoffw.* 22, 122(1927).—K. describes recent chem. warfare developments in England, the U. S. and France. In England a comm. has been formed to take charge of chem. warfare. The War Department, the Marine Corps and the Air Corps are represented on the comm. which likewise includes 10 chemists, scientists and representatives of the chem. industries. In America there is difficulty in retaining experienced chemists in the War Department on account of the higher salaries paid by the chemical industries. Emphasis is placed on developments which have peacetime uses. Research is being done on the perfection of the gas mask and on the dispersion of smokes from airplanes. In France a comm. on gas defense has been formed under the leadership of the Ministries of Defense, Commerce and Industry. Its duties consist in the establishment of such industries as can be readily converted to war purposes.

J. S. REICHERT

War gases. PAUL PASCAL. *Z. ges. Schiess-Sprengstoffw.* 22, 155-6(1927).—P. divides war gases into the following classes: asphyxiating and lethal, lachrymatory, vesicant, sternutatory, emetic and smoke-producing. French war-time production figures for war gases are given and gas cloud attacks are discussed.

J. S. REICHERT

Gas defense. AUGUST SCHRIMPF. *Z. ges. Schiess-Sprengstoffw.* 22, 118(1927).—An introduction to a new section on gas defense describing its purpose and scope.

J. S. REICHERT

The development of gas defense since the World War. ULRICH MÜLLER. *Z. ges. Schiess-Sprengstoffw.* 22, 118-20(1927).—M. gives a brief review of the development of the gas mask.

J. S. REICHERT

Industrial gas masks. RUDOLF HANSLIAN. *Z. ges. Schiess-Sprengstoffw.* 22, 150-2(1927).—For every existing industrial need a reliable gas mask is available. The mouth respirator affords no protection for the eyes but with the proper chem. filling in the canister it will give adequate protection against vapors of org. solvents, acid fumes, NH_3 , HCN , H_2S and dusts such as are produced in the alkali industry, in sand-blasting, in paint spraying, etc. The adsorptive capacities of the various types of chem. fillings for the replaceable snout canister of the German army type mask are: Type A, 22.5 g. acetone, 10.5 g. benzene; Type B, 7.5 g. phosgene, 6.1 g. HCl , 6.1 g. oxides of nitrogen; Type E, 20.5 g. SO_2 , 20.5 g. HCl , 8.3 g. oxides of nitrogen; Type F, 8.4 g. Cl , 0.34 g. NH_3 , 3.3 g. H_2S , 0.6 g. chloropicrin, 3.45 g. SO_2 ; Type G, 2.5 g. HCN ; Type K, 2.9 g. ammonia; Type L, 4.5 g. hydrogen sulfide; Type M, 1.2 g. H_2S , 2.4 g. NH_3 ; Type O, 13.1 g. PH_3 , 12.6 g. AsH_3 . Protection against mists and smokes requires a larger canister, which is carried on the chest or the back. A special chem. filling (*Hopcalite*) is required for protection against CO. A warning agent is used in the canister to indicate the break-point against CO. The universal canister contains the required chemical

filing to protect not only against CO, illuminating gas, water gas, producer gas, blast-furnace gas, stack gas, suffocating gases resulting from explosions of fire and coal dust, provided the oxygen supply remains sufficiently high, but also against vapors of org. solvents, acid fumes, Cl , NH_3 , H_2S and AsH_3 .

Electrical resistivity of insulating materials. H. L. CURTIS. *J. Am. Inst. Elec. Eng.* 46, 1095-1103 (1927). J. S. REICHERT C. G. F.

Electrical insulating materials. A. GÜNTHERSCHULZE. *Z. Elektrochem. angew. physik Chem.* 33, 360-9 (1927).—A review of the general theory of dielectrics, and peculiarities of gaseous, liquid and solid insulators. Specifications are given for transformer oil and for solid com. insulators. D. GORDON

Soft rubber filter-press plates and frames (FRITZ, CLARK) 30. Insulating paper (Brit. pat. 262,828) 23.

HANSLIAN, RUDOLF: *Chemical Warfare*. Berlin: E. S. Mittler & Sohn. Revised and enlarged edition. 450 pp. 17 M. Reviewed in *Z. ges. Scheiss-Sprengstoffw.* 22, 157 (1927); cf. C. A. 21, 3404. J. S. REICHERT

Treating liquids. W. EVANS. Can. 274,013. Sept. 20, 1927. A process of treating liquids, e. g., softening water, consists in mixing in aq. soln. lime, Na_2CO_3 , and $\text{Na}_2\text{Al}_2\text{O}_4$, and then mixing the resultant product with the liquid to be treated. The resultant ppts. are sepd. from the liquid.

Treating liquids. W. EVANS. Can. 274,014. Sept. 20, 1927. Lime and Na_2CO_3 are mixed in aq. soln., then the product is mixed with the liquid to be treated, and $\text{Na}_2\text{Al}_2\text{O}_4$ is added. The resultant ppts. are sepd. from the liquid.

Purifying liquids. UDDEHOLMS AKTIEBOLAG. Swed. 63,515, Aug. 16, 1927. The liquid to be purified is mixed with sulfite cellulose waste liquor in the liquid state after which the purified liquid is sepd. from the impurities by decantation, distn. or another suitable procedure.

Alumina-containing coagulant for clarifying liquids. H. M. SPENCER. U. S. 1,643,962, Oct. 4. A concd. soln. is formed contg. alumina and sufficient SO_3 to effect peptization of the alumina.

Heating gases or liquids. A. HALLBÄCK. Swed. 63,569, Aug. 23, 1927. A part of the gases giving off heat after having passed through the heating app. is again introduced into the app. in order to reduce the temp. of the gases to the desired value.

Drying gases. W. MÜLLER. U. S. 1,644,439, Oct. 4. A soln. of P_2O_5 in H_3PO_4 is used for drying air or other gases.

Discharging carbon dioxide under high pressure. C. L. JONES. U. S. 1,644,338, Oct. 4. The greater part of the pressure drop is localized at a constricted discharge orifice, and the passage leading to the orifice is thermally insulated from the cooled expanded stream of CO_2 emerging from the orifice, to prevent stoppage of flow.

Separating an emulsion or a colloidal solution into its components. B. JOHNSON. Swed. 62, 678, March 29 (1927). The emulsion or colloidal soln. is intimately mixed with a carboxylic acid which is sol. in the disperse substance but insol. or only slightly sol. in water.

Separating crude shellac solutions or other liquids from suspended matter centrifugally. F. C. RAWOLLE. U. S. 1,644,492, Oct. 4.

Composition for generating irritant fumes for defensive or offensive purposes. J. A. PRENTICE. U. S. 1,643,954, Oct. 4. A smoke-generating ingredient such as SnCl_4 is used together with bromobenzyl cyanide or xylol bromide or other irritant and a persistently odorous substance such as Bu mercaptan.

Vacuum refrigerating system using dichloroethylene as a refrigerant. W. H. CARRIER and CARRIER ENGINEERING CORPORATION. Brit. 263,052, Aug. 11, 1925.

Working fluid for refrigerating apparatus. A. A. KUCHER. U. S. 1,645,198, Oct. 11. A soln. comprising EtCl and a mineral oil is used.

Insulating material. A. U. WESTFELT. Swed. 62,702, June 8, 1927. A porous insulating material is produced by mixing water glass with a gas-forming substance, for instance KClO_3 or other suitable materials, and drying and heating the mixt.

Heat- and sound-insulating material. W. E. NELSON and T. B. HENNESSEY. U. S. reissue 16,753, Oct. 4. A sheet of unsatd. felt has a layer of asphalt on its face forming a surface adapted to receive plaster.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Mineral waters of Loutraki. EM. EMMANUEL. *Arch. Pharm.* **265**, 550-4(1927).—The waters of this region (opposite Corinth) are oligometallic, being divided into 2 groups, as alkaline salt springs taken largely for curative purposes, and alkaline magnesia springs which furnish the municipality with drinking water. Water of the first group was clear, colorless, odorless, had a mild salty taste and the following characters: temp. 31.45°, d_{18} 1.0016, freezing-pt. depression 0.125, elec. cond. K_{18} 0.00351, radioactivity 10.39 Mache units. Chem. compn.: alky. in terms of NaHCO_3 0.1008 g. per kg., total residue 2.1562 g. SiO_2 0.0147%, CO_2 (free) 0.02685 g. per kg. = 13.67 cc. under normal temp. and pressure. The compn. as calcd. from the various ions detd. is: NaCl 1.24268, NaHCO_3 1.14076, K_2SO_4 0.00946, MgCl_2 0.34720, $\text{Ca}(\text{HCO}_3)_2$ 0.18529, CaSO_4 0.20689, $\text{Fe}(\text{HCO}_3)_2$ 0.00084, $\text{Al}_2(\text{SO}_4)_3$ 0.00839, H_2SiO_3 0.01470, with traces of Li, Mn, Br, I, nitric and phosphoric acids. Water from the 2nd group was clear, colorless and odorless, and possessed a peculiar sweetish taste. It had a temp. 19.5°, d_{18} 0.9990, freezing-pt. depression 0.020, elec. cond. 0.00088, radioactivity 0.813 Mache units. Chem. compn.: alky. in terms of NaHCO_3 0.2352 g. per kg., total residue 0.4468%, SiO_2 0.0150 g. %, CO_2 (free) 0.0342 g. per kg. = 17.41 cc. under normal temp. and pressure, N-free org. material 0.011%, hardness (German) 23.22° (French) 41.46°. Compn. calcd. from the ions is KHCO_3 0.00705, NaHCO_3 0.09797, $\text{Mg}(\text{HCO}_3)_2$ 0.53836, MgSO_4 0.00785, MgCl_2 0.01454, CaCl_2 0.02758, $\text{Fe}(\text{HCO}_3)_2$, $\text{Al}_2(\text{SO}_4)_3$ 0.00201, H_2SiO_3 , traces of Li, Mn, nitric and phosphoric acids, and org. material.

W. O. E.

The springs of Bad Salzhausen. FRITZ FENSSLIN. *Notizblatt ver. Erdkunde Hess Geol. Landesanst. Darmstadt* **1925**, 251-5; *Chem. Zentr.* **1926**, II, 1006-7.—The sinter which is deposited in the open around the NaCl springs was examd. As, Pb, Zn, Mn and PO_4 were detected for the first time. From the analyses, certain conclusions regarding the origin of the springs and their connection with those of Bad Nauheim are drawn.

C. DAVIS

Further contributions to river-water control. JULIUS ZINK AND FRIEDRICH HOLANDT. *Z. angew. Chem.* **40**, 1062-4(1927).—To explain the fate of Mg salts thrown into river water and then disappearing, expts. were conducted with clays and clay-soils. The disappearance of the Mg and formation of Ca compds. in the water is ascribed to the presence of zeolite-like substances in the clays used. This exchange of bases is, therefore, the reason for the alteration in the salt content of river water.

W. C. EBAUGH

Report of an investigation of the pollution of Lake Michigan in the vicinity of South Chicago and Indiana Harbors. ANON. *U. S. Pub. Health Service, Pub. Health Repts.* **42**, 2200-2(1927).—Sewage and trade waste from the Calumet district discharged into Lake Michigan render the sources of water supply of Hammond, Whiting and E. Chicago unfit for such use and seriously pollute the supply of Gary. The Chicago intakes at Dunne and 68th streets are endangered at times. North of these points only Waukegan and Lake Forest are endangered. If this is to remain a source of water supply for Chicago and nearby towns existing pollution should be abated. F. D. S.

Stream pollution in Wisconsin. C. M. BAKER, L. F. WARRICK, E. J. TULLY, O. J. MUEGGE, J. P. SMITH AND C. L. TURNER. *Paper Trade J.* **85**, No. 10, 43-7(1927).—A joint report of the Conservation Commission and State Board of Health of Wisconsin concerning activities in the control of stream pollution, from July 1, 1925 to Dec. 31, 1926. Preliminary investigation with samples of sulfite waste liquor indicated that its O demand can be reduced approx. 50% by forcing air into it through the pores of a basswood block, apparently confirming the opinion that a large part of the initial demand is direct chem. oxidation of the unstable constituents. The O demand for periods from 12 hrs. to 5 days can be reduced 76-92% by ponding (storing in an open reservoir or pond) and aeration. Cooling and settling of the waste liquor in the storage reservoir is much more effective in reducing the O demand than aeration over a cascade spillway. It is believed that the initial O demand, or that responsible for the immediate depletion of O in a stream just below a sulfite mill, is materially, if not completely, satisfied during the 2-3 days settling period. The report covers a study of the chief streams of Wisconsin as to the degree of pollution, the main source of which is the pulp and paper industry.

A. PAPINEAU-COUTURE

Inspection of water supplies and sewerage systems. A. E. BERRY. *Pub. Health J. (Can. Pub. Health Assocn.)* **18**, 339-42(1927).—A general discussion. R. E. T.

A problem of municipal water supply in the oil fields. F. M. VEATCH. *Eng. News-Rec.* 99, 394-5(1927).—A description of the new water supply system of El Dorado, Kans., which consists of an impounding dam on Satchel Creek, a 24-in. cast iron flow line and a clear water reservoir. The water will be delivered to the existing 2-m. g. d. filtration plant constructed for the purification of the former supply from Walnut River which had to be abandoned owing to oil waste pollution. R. E. THOMPSON

The examination and judging of water. W. APPELIUS. *Ledertech. Rundschau* 19, 81, 93-9, 111-5(1927).—Outline and methods for water analysis are given. I. D. C.

Glaucinite in water softening. R. H. FIMERICK. *Power* 66, 401(1927).—Glaucinite is prepd. from greensand by cleaning, screening and color fixing. It usually delivers water having a hardness not in excess of 10 to 12 p. p. m. in terms of CaCO_3 . Glaucinite does not belong to the zeolite group. D. B. DILL

Water softening in the home. EDWARD BARTOW. *Proc. Iowa Acad. Sci.* 33, 165-8(1926).—A brief popular discussion of the lime soda process and the base exchange or zeolite process of treating water in the home to improve its condition. W. G. G.

Intermittent lime feed plan reduces incrustation from softened water. L. C. BILLINGS. *Eng. News-Rec.* 99, 70(1927).—Intermittent lime treatment at the 40-m. g. d. plant at Grand Rapids, Mich., has materially reduced carbonate incrustation of mains from lime-softened water and has permitted a reduction in the amt. of lime used. The raw water hardness, which is 14 grains per gal., is reduced 50% by the treatment, which accomplishes the same results as the "split treatment" method, although the resulting water is 2-3 grains per gal. harder than when full lime treatment is employed. R. E. THOMPSON

Settling basin for water works of Lawrence, Kansas. WYNKOOP KIERSTED. *Eng. News-Rec.* 99, 65(1927).—Illustrated description of the recently completed settling basin at Lawrence which consists of 4 compartments for (1) natural sedimentation, (2) mixing and application of chemicals, (3) chem. reaction and (4) final sedimentation, the retention periods at the rated capacity of 3 m. g. d. being 2 hrs., 21 min., $\frac{1}{2}$ hr., and $3\frac{1}{2}$ hrs., resp. The water is delivered into the coagulation compartment through a series of vertical slots 5 ft. high, with a width beveled outward from $\frac{1}{2}$ to 2 in. The preliminary and coagulation basins are double hopper bottomed, provision being made for drawing off sludge without disturbing the main valve. R. E. THOMPSON

The treatment of beet flume and washer waters. PAUL HIRSHFELDER. *Centr. Zuckerind.* 35, 273-4(1927).—Such waters may be treated by (A) simple settling basins. The first cost is small, but the cost of sludge disposal is heavy, and trouble is experienced because of putrefaction in the sludge. (B) The waste water may be pumped into fields, which are used for cultivation after a layer of sludge has built up. This involves heavy charges for land, and the results are not satisfactory, because of the settling of sand in the nearer areas. (C) Small settling basins with continuous sludge removal may be used, and the heavy sludge formed pumped to waste land. This is often satisfactory, especially where the sludge need not be pumped far. (D) Where sludge must be transported over 2 kilometers, a settling basin with a slow-moving rake should be used to produce a sludge of not over 10-15% solids. This may be pumped without undue expense and without danger of sand settling out. W. L. BADGER

An experience with manganese in textile water. C. F. GOLDTHWAIT. *Am. Dyestuff Rept.* 16, 605-8(1927).—Mn is more frequently present in a municipal water supply than is commonly supposed, and, if not removed, occurs as weak as 1 part per million cause trouble on coming in contact with textiles. In the case studied Mn was removed by the addn. of FeSO_4 as a coagulant to the city supply before reaching the filters. L. W. RIGGS

Taf Fechan impounding reservoir and works. THOS. F. HARVEY. *Water and Water Eng.* 29, 309-17(1927).—The Taf Fechan reservoir: its inception, gagings, yield, embankment and cut-off trench, overflow shaft, valve tower, filtration plant, clear water tank, pipeline and break-pressure tank are fully described. J. A. KENNEDY

Effluent aerators control mechanical filters. MALCOLM PIRNIE. *Eng. News-Rec.* 99, 376-80(1927).—Effluent aerators at the Providence, R. I., West Palm Beach, Fla., Poughkeepsie, N. Y., and Rahway, N. J., filter plants are described and the results attained are tabulated. As a result of aeration the p_H values of the waters are increased 0.2-0.3 and the CO_2 contents reduced 1-7.5 p. p. m. R. E. THOMPSON

The applicability of the determination of sulfuric acid by means of benzidine to water analysis. L. W. HAASE. *Chem.-Ztg.* 51, 637-8(1927).—Data from which the conclusions published in a previous paper (C. A. 21, 2235) were drawn are now given in fuller detail. W. T. H.

Rapid determination of carbon dioxide in water. LENNART SMITH AND GUNNAR

WODE. *Svensk Kem. Tids.* 39, 63-74(1927).—The titrations of free CO_2 with phenolphthalein, HCO_3^- with Me orange, and estg. total CO_2 by a scheme of acidifying, evacuating and fixing with Ba (A. Westerberg, *Svensk Tekn. Tids.* 40, 49(1910)) are discussed at length. Tests of free CO_2 by titration, total CO_2 minus Me orange titration, and by Westerberg's indirect method are compared with the calcd. values from complete water analysis. The first two series agree very well but the last does not. The Me orange titration and Westerberg's indirect HCO_3^- method are compared with HCO_3^- calcd. from complete analysis and both agree within 5% error. The sum of phenolphthalein and Me orange titrations is in good agreement with the total CO_2 values detd. by the above method. A. R. ROSE

Iodine and goiter in Utah and use of the Cottrell precipitator in iodine analysis. J. F. MCCLENDON. *Proc. Soc. Exptl. Biol. Med.* 23, 494-6(1926).—In a given community the I content of water varies. A low I content is assocd. with a high incidence of goiter among school children. A modification of the Cottrell precipitator for I analyses is described. C. V. B.

Aerobic spore-forming bacilli which ferment lactose. S. A. KOSER AND W. C. SHINN. *J. Am. Water Works Assocn.* 18, 328-36(1927).—Describes work done in an effort to identify such forms. *B. asterosporus* has the proper characteristics. The water analyst should recognize and guard against such forms. D. K. FRENCH

Brilliant green bile for the detection of the colon-aerogenes group. H. E. JORDAN. *J. Am. Water Works Assocn.* 18, 337-46(1927).—Following much investigation parallel planting in lactose broth and brilliant green lactose bile is recommended. The following new terms are explained: "partially confirmed," "double presumptive," "confirmed coli," and "confirmed aerogenes" D. K. FRENCH

Preventing incrustation of pipe lines in lime-soda treatment. WM. M. BARR AND H. W. FAUS. *Railway Engineering and Maintenance* 23, No. 6, 257(1927).—Municipal practice of introducing CO_2 into the treated water is not practical for steam-plant service. Sodium aluminate appears to give best results. R. C. BARDWELL

Cutting the cost of water treatment \$2.27 per 100,000 gallons. C. R. KNOWLES. *Railway Engineering and Maintenance* 23, No. 5, 211(1927).—Illinois Central Railroad has reduced the treatment expense by recovering filter wash water and less sludging loss with conical bottom tank. Construction details for chem. app. housing and pressure filter are shown. R. C. BARDWELL

Self-damping gage for determining heads in pipe lines. D. S. ELLIS. *Eng. News-Rec.* 99, 478(1927). R. E. THOMPSON

The ideal water pipe. The supply of pure water for human consumption and the method whereby it can be obtained. S. DICKSON. *Water and Water Eng.* 29, 323-4(1927).—After stating why most pipes fail to meet the ideal, D. concludes that a metal pipe lined with cement mortar by the centrifugal method is ideal. This combines the properties of the "stony gathering ground" with long length and few joints, plus the added properties of great strength, resistance to shock, and a denseness of lining of extraordinary quality. The lining also protects the metal from corrosion. J. A. K.

Boiler water tests should be utilized. I. C. E. JOOS. *Power Plant Eng.* 31, 769-71(1927).—Description of app. and methods for making hardness and chloride detns. in boiler feed water. II. *Ibid* 895-7.—The analyses form the bases for checking leaky blow-off valves and broken baffles and for detg. scale removal or formation while boilers are in operation. S. D. POARCH

Scaling of boilers by softened water. Method of prevention. P. LE TELLIER AND H. SUNDER. *Paper Industry* 9, 793-5(1927); *Paper Maker and Brit. Paper Trade J.* 74, 255, 259(1927).—See C. A. 21, 785. A. PAPINEAU-COUTURE

The theory of boiler-scale formation. R. STUMPER. *Arch. Wärmewirt.* 8, 271-5(1927).—S. discusses scale formation from a phys. chem. viewpoint, and reports the results of expts. showing that the thermal decompn. of Ca and Mg bicarbonates in soln. is monomol. ERNEST W. THIELE

Sewerage and sewage treatment with particular reference to the activated-sludge process. HERBERT E. BELLAMY. *Commonwealth Eng.* 15, 32-4(1927).—A review. FOSTER D. SNELL

Modern methods of sewage disposal. W. M. VEITCH. *Contract Record Eng. Rev.* 41, 754(1927).—A general discussion. R. E. THOMPSON

Schenectady sewage chlorination studies, 1926-7. M. M. COHN. *Eng. News-Rec.* 99, 229-31(1927). cf. C. A. 20, 3763.—Additional observations on chlorination at the Schenectady sewage works are given. Parallel tests of raw sewage and Imhoff tank effluent indicated that the Cl_2 demands were practically the same. There was a marked improvement in the odor of the effluent from Imhoff tanks treating sewage

chlorinated at the rate of 4-6 p. p. m., although no residual Cl_2 could be detected after the sewage had entered the tanks. The H_2S content was greatly reduced, and although H_2S was never absent, no septic odor was ever noted. The biochemical O_2 demand of the effluent was 27% less than that from untreated sewage. No deleterious effect on sludge digestion was observed. The odor of the sludge from tanks receiving treated and untreated sewage has been similarly slight, the consistency of the former being somewhat heavier, the color somewhat darker and the org. matter content slightly lower. Expts. by G. M. Fair indicated that the chlorinated solids digest more rapidly and that CH_4 production at the end of 2-3 weeks is practically twice as great. Application of 25 p. p. m. Cl_2 to tank effluent applied to sprinkling filters for a 48-hr. period removed the heavy gelatinous film on the surface of the media and decreased the no. of *Psychoda alternata* present. Similar treatment for 24-hr. periods at 2-week intervals resulted in a decrease in fly life in the majority of instances. The immediate effect of chlorination was a sudden drop in stability and oxidized N content of filter effluent, probably due to marked unloading. Nitrification increased to normal about a week after treatment and was fairly satisfactory during the balance of the period before the next chlorination. The filter effluent stabilities during the winter of 1926-7, following intensive chlorination during the summer months, were higher than during the previous winter and the oxidized N content was equally high. Fly exterminations with *o*-dichlorobenzene has been continued as routine procedure with marked success. A mixt. of equal parts of *o* dichlorobenzene and kerosene has been found just as effective. R. E. THOMPSON

Operation of sewage works of Pontiac, Mich. J. R. POLLOCK. *Eng. News-Rec.* 99, 434-5 (1927).—Brief data are given on the operation of sewage works of Pontiac, which consists of a grit chamber, Imhoff tanks, sprinkling filters, secondary tanks and a sludge drying bed. The effluent is discharged into the Clinton River, which provides dilution of not more than 0.3 sec.-ft. per 1000 population. The normal dry weather flow is 3.8 m. g. d. The cost of operation during 1925 and 1926 was, resp., \$0.152 and \$0.167 per capita or \$5.44 and \$6.00 per m. g.

R. E. THOMPSON

Experiences in destroying sewage screenings by burning. R. A. APPLETON. *Eng. News-Rec.* 99, 500-2 (1927).—The screenings from the two 12-m. g. d. Dorrco screens at Long Beach, Cal., are destroyed by incineration, natural gas being used as fuel. The screenings removed on the av. 30.7 cu. ft. per m. g. During 1925 6 an av. of 105.8 cu. ft. of gas was consumed in incinerating each cu. ft. of wet screenings and the av. total cost of incineration was 4.025¢ per cu. ft. The temp. in the combustion chamber varied between 1561° and 1690° F. An analysis of the ashes removed, which varied from 0.5 to 1.15% of wt. of screenings burned, showed: SiO_2 , 46.14; P_2O_5 , 10.82; K_2O , 2.85; and Na_2O , 1.82. No complaints of nuisance have been received. R. E. THOMPSON

Replacing wood-stave outfall sewer with concrete at El Paso. ROBT. P. ANDERSON. *Eng. News-Rec.* 99, 175-6 (1927).—Description of 36-in. concrete outfall sewer built to replace a wood-stave line which was approaching failure due to rusting of iron bands, to action of gases on the top part of the staves and to rotting on the outside of the bottom staves. The iron bands appeared to have failed where gas was escaping through the pipe. The pipe was of Alamogordo pine, 1070 ft. long from septic tanks at El Paso, Tex., to the Rio Grande. The septic tanks consist of 15 compartments which are used in succession as digestion proceeds, the av. flow being 6 m. g. d. and max. flow 12 m. g. d.

R. E. T.

Sewage chlorination beneficial at Singapore. A. G. HARRINGTON and C. E. WHITTAKER. *Eng. News-Rec.* 99, 238 (1927).—The Singapore sewage works include a roughing screen, detritus tanks, Imhoff tanks, filters and humus tanks. Chlorination of the filter influent was experimented with in an attempt to eliminate ponding, 2 p. p. m. Cl_2 being applied for 8 hrs. each day. The treatment reduced the free NH_3 content of the effluent from 12 to 6 p. p. m., the O_2 absorbed from 13 to 6 p. p. m. and the suspended matter from 35 to 20 p. p. m., and increased the nitrates from 6 to 15 p. p. m. There was no reduction in the gelatinous film, but ponding was slightly decreased. Chlorination at the rate of 3 p. p. m. for 8 hrs. each day or at 2 p. p. m. continuously was not as effective.

R. E. THOMPSON

New sewage treatment plant at Wichita Falls, Texas. JULIAN MONTGOMERY. *Water Works* 66, 289-90 (1927).—The plant which is designed to treat 3 m. g. p. d. of domestic sewage from a sep. system consists of pumping station, screen and grit chamber, four Imhoff tanks, sludge drying beds, dosing tanks, trickling filters and a Dorr equipped secondary settling tank.

C. C. RUCHHOFF

Results from Passaic Valley sewer. ANON. *Public Works* 58, 210-3 (1927).—The Passaic Valley intercepting sewer has increased the percentage satn. of dissolved O in the Passaic River from 14% during its first year of operation to just under 25%

during its second year. The percentage satn of dissolved O has been increased at all points in Newark Bay and conditions in the sewage diffusion area in New York Bay are no worse than formerly.

Sewage plant records. J. R. DOWNES. *Water Works* 66, 335-6(1927).—The O demand, suspended solids and the p_{H} detns. are recommended as the best tests for routine sewage plant control.

The fate of *B. coli* and *B. aerogenes* in sewage purification. H. HEUKELKIAN. *J. Bact.* 14, 55-67(1927).—It is probable that the colon group is mainly responsible for the decompn. of available carbohydrates giving rise to high acidity which checks its own numbers.

Production of illuminating gas from the Stuttgart Sewage filter plant. W. SOMMER. *Gas u. Wasserfach* 70, 945-9(1927).—A daily gas production of 3000 4000 cu. m. of gas is obtained from the anaerobic fermentation of sludge from the S. sewage (population of Stuttgart 350,000). The gas analyzes about 12 to 20% CO_2 , 4.8% H_2 , 75.5% CH_4 , and 4.7% N_2 , and has a calorific value of 7500 to 8500 cal. per cu. m. The method of recovery of this gas is described and illustrated. The gas is sold to the Gaisburg gas works.

Measurement of atmospheric pollution, visible and invisible. G. T. MOORE. *Mech. Eng.* 49, 1067-8(1927).—The methods for solid matter include "soot-fall," Owens automatic air filler and a jet dust counter. Acid is measured by the cond. of water exposed to the air sample. Germs are collected by drawing air through sterile sand, extg. with water and plating out. A characteristic salivary organism serves as indicator in the same way as *B. coli* indicates sewage pollution.

Garbage and refuse disposal at Fort Dodge, Iowa. BYRON BIRD. *Water Works* 66, 235-9(1927).—Refuse is disposed of in municipal dumps and garbage is incinerated in a plant that is described in detail.

Treating liquids (Can. pat. 274,013) 13.

Woodford county soils. R. S. SMITH, E. E. DETURK, F. C. BAURER and L. H. SMITH. Univ. Ill. Agr. Expt. Sta., *Soil Rept.* No. 36, 57 pp.(1927).—The soils of the

county are classified and chem. analyses showing the content of essential plant food elements in each of the important types given. M. S. ANDERSON

Lee County soils. R. S. SMITH, O. I. ELLIS, E. H. DETURK, F. C. BAUER AND L. H. SMITH. Univ. Ill. Agr. Expt. Sta., *Soil Rept.* No. 37, 65 pp. (1927).—A classification of soil types and chem. analyses of each are given. M. S. ANDERSON

Soil survey of the Artibonite plain. E. O. PIPPIN. Rep. Haiti Service Tech. Dept. Agr., *Bull.* No. 5, 5-210 (1926).—Examn. of 50 soil horizons from the Artibonite plain of Haiti shows the majority to be of high clay content. The sp. grs. of these soils are very low compared with similar data of the soils of temperate regions, ranging from 2.30 to 2.56 with an av. of 2.37. The soils all have a high lime content, varying from 7.5 to 82%. The av. is 32% CaCO_3 . The av. SiO_2 content is about 39%. N and org. matter are, as a rule, higher than in American soils, and the K and P content is somewhat lower. More than half of the soils analyzed had a K_2O content of less than 1.0%. In view of the low availability of the K this quantity must be considered as inadequate. P treatments are suggested for improving the availability of the K. The subsoils show about the same plant food deficiencies as the surface soils. 52% of the land contains less than 0.2% alkali salts. 24% is moderately charged, contg. 0.2 to 2.0% and 24% of the soils contain more than 2.0% of sol. alkali salts. About 65% of the total area is considered suitable for cultivation. Water exts. of the soils are for the most part neutral in reaction although a few contain small quantities of Na_2CO_3 . Cl and HCO_3 anions predominate. The river waters carry an av. total-solid content of about 200 p. p. m., most of which is bicarbonates. M. S. ANDERSON

Biochemical methods for determining assimilable quantities of potash, phosphorus and nitrogen in soil. I. The method of Neubauer and Schneider. STANISLAW HOLYNSKI. *Mém. Inst. natl. Polonais économie rurale Pulaaway* 7, 245-60; *Chem. Zentr.* 1926, II, 2482.—The limiting values given by Neubauer and Schneider were confirmed for soils from the region of Bydgoszcz. The exptl. plants had to be grown at 15-17° in diffused light. The wt. of the seedlings was less than that of the seeds used. There was less assimilated P present than in the seeds. On peat and clay soils, the water requirement of seedlings is greater than the data of Neubauer and Schneider. The method is regarded as a good qual. test of the nutrient requirements. C. C. D.

The determination of the salinity of soils from the electrical conductivities of their aqueous extracts. N. K. VOSKRESSENSKA. *Ann. inst. anal. phys. chim.* 3, 302-4 (1926).—No simple relationship was found between humin content and cond.

BASIL C. SOYENKOFF

The total sulfur content of arable soil. G. BERTRAND AND L. SILBERSTEIN. *Compt. rend.* 184, 1388-90 (1927).—Analyses of a no. of samples of French soils show that the proportion of S in cultivated soils varies within rather wide limits and sometimes drops to a very low value. The highest content was found in the Lower Seine region and the lowest in the Gard. The regions highest in S are among the most fertile. It is logical to assume that fertilizers contg. SO_4 are of benefit to soils very low in S. P. R. D. *

The determination of sulfur in arable soil. G. BERTRAND AND L. SILBERSTEIN. *Bull. soc. chim.* 41, 950-4 (1927); cf. preceding abstr.—A 5-g. sample of air-dried soil is digested for an hr. with occasional shaking in a Kjeldahl flask (approx. 200 cc.) on a water bath, with 15 cc. of redistd. fuming HNO_3 (d. 1.5). The contents are then transferred to a porcelain evapd. dish, a little water being used to remove remaining particles. (The digestion may be carried out directly in the dish by covering with a funnel whose diam. is slightly less than that of the dish.) The contents of the dish are evapd. on a water bath to the consistency of paste. A 10% soln. of Na_2CO_3 is then added, with stirring, from a graduated pipet, until cessation of effervescence (neutralization). About 6-10 cc. are required. A further vol. of the Na_2CO_3 soln., equal to that already used, is then added and the mixt. transferred to a 75-cc. Ni crucible. Approx. 10 g. of a powdered equimol. mixt. of NaNO_3 and Na_2CO_3 (or better KNO_3 and Na_2CO_3) are then added, the mixt. is evapd. to dryness on a water bath, and heated just to fusion in a small elec. furnace, the mass being stirred now and then with a large Fe or Ni wire. When the reaction is complete (CO_2 no longer evolved) the melt is cooled, taken up in water, transferred to a porcelain dish, treated with 20 cc. of concd. HCl and evapd. to dryness. The residue is again moistened with 10 cc. of HCl and evapd. This residue is moistened with HCl, more water added, filtered and the S detd. as BaSO_4 . It is absolutely necessary that all heating with gas be avoided, to prevent contamination with S. A series of results obtained on a garden soil are presented. The losses of S in calcining in air or in the presence of a mixt. of alk. NO_3 and CO_2 were found to be 41.4 and 13.1%, resp. Hence, these methods are subject to great error. Preexistent sulfates are detd. by extn. with boiling water acidified with HCl. Several repetitions

of the process are necessary. The org. S, including any free S, is detd. by difference.

P. R. DAWSON

Normal moisture capacity of soils. C. F. SHAW. *Soil Science* 23, 303-17(1927).—The normal-moisture capacity is the minimum quantity of H_2O retained by absorption and film forces when the H_2O is free to move downward through a uniform soil. With the soils of medium texture studied it is approx. the same as the moisture equiv. This water is available for plants but is essentially static.

R. BRADFELD

Maximum height of capillary rise starting with soil at capillary saturation. C. F. SHAW AND ALFRED SMITH. *Hilgardia* 2, 399-409(1927).—With a water table at a depth of more than 10 ft. below the surface, no losses by evapn. from the surface will occur from soils similar to Yolo loam or sandy loam. This conclusion is likewise probably applicable to sandy loams or loams in general.

CARL R. FELLERS

Colloidal behavior of soils and soil fertility. III. Cation replacement and saturation of soil with calcium. J. S. JOFFE AND H. C. MCLEAN. *Soil Science* 23, 127-35(1927); cf. *C. A.* 20, 2039.—A discussion of soil acidity problems from the cation replacement standpoint. The exchangeable H ion detd. by the complete neutral salt extn. methods gives with the New Jersey soils studied a better index to lime requirement than the methods more commonly used.

R. BRADFELD

The hydrometer as a new and rapid method for determining the colloidal content of soils. G. J. BOUYOUCOS. *Soil Science* 23, 319-31(1927).—A 50-100 g. sample of soil is dispersed in 1000 cc. of H_2O contg. 5 cc. N KOH by a motor-driven stirrer in a specially constructed cup for 9 min. After standing undisturbed for 15 min. the sp. gr. of the suspension is detd. and the colloid content calcd. The results obtained by this method show a fair agreement with those obtained by the heat of wetting method.

R. BRADFELD

The phenomena of contraction and expansion of soils when wetted with water. G. J. BOUYOUCOS. *Soil Science* 23, 119-26(1927).—The vol. change occurring when soils are mixed with water was measured with a dilatometer. In order to displace all air the soil was first mixed with CCl_4 . Water was then added on top of the layer of CCl_4 . The heavier liquid prevented contact of the soil with water until the latter had reached a const. temp. The water and soil were then brought into contact by tipping the dilatometer and the change in vol. which occurred was measured. Twenty soils, 3 soil colloids, muck, silica gel and fuller's earth were used. In all cases, a decrease in vol. was observed when wetting occurred, varying from 0.033 cc. per 100 g. soil for sand to 4.666 for muck. In general, the soils of high colloidal or high org. content gave the greatest contraction. The correlation between vol. of contraction and colloidal content was not as close as between vol. of contraction and heat of wetting. B. attributes the phenomena of contraction principally to the condensation of some of the water on the surface of the soil particles.

R. BRADFELD

Differences in heat of reaction between artificial and soil gels of silica, alumina and iron with hydroxides. G. J. BOUYOUCOS. *Soil Science* 23, 243-7(1927).—The heat developed when a series of soils and artificial gels was treated with 3 N NaOH and KOH was detd. The heat of reaction is defined as the difference between the total heat developed on treatment with alkalis and that developed when wetted with water. The heats of wetting of the soils and gels were of the same order of magnitude but the heat of reaction of the gels was much greater. This is attributed to a partial soln. of the gels by the alkalis.

R. BRADFELD

Organic matter changes in two soil zones, as influenced by differences in form, fineness and amount of calcic and magnesian materials. W. H. MACINTYRE, W. M. SHAW AND E. M. CRAWFORD. *Soil Science* 23, 107-17(1927).—In the first of 2 series of lysimeter expts., addns. of $Ca(OH)_2$ in varying amts., $CaO-MgO$, limestone and dolomite of varying fineness were made to only the surface zone of the lysimeters. In the 2nd series, the same addns. were made to the subsurface zone only. After 4 yrs.' exposure without crops and without stirring, the org. CO_2 in both zones of both series was detd. In the first series, the av. org. CO_2 of the surface zone was somewhat less than the control; that of the subsurface zone was the same as the control. Large variations in the amt. of $Ca(OH)_2$ added did not produce proportionately large variations in org. CO_2 content, and variations in fineness of limestone and dolomite did not produce marked differences in CO_2 content. In the 2nd series, the av. org. CO_2 of the surface zone was similar to the control, and no differences due to amt. or fineness of the subsurface addns. were observed; the av. CO_2 content of the subsurface soil was somewhat less than the control. No effect on the untreated zone was produced by treatment of the other, and the accelerative effects of liming were comparable in both zones.

R. BRADFELD

Decomposition of organic matter and changes in nitrification and absorption power of soils. A. F. TYULIN. *Trans. Sci. Inst. Fertilizers* 33, 5-78(1926).—The effects of lime on a podsolized soil were studied. As a source of org. matter a highly dispersed ext. of lupine, incubated for 30 days under aerobic condition, was used; 200 cc. of the ext. (the latter was prep'd. by treating the dry lupine after incubation with twice its weight of water and passing it through a linen cloth) were added to each kg. of soil. The amt. of lime equalled 1%. One series of pots was leached twice with dist'd. H_2O , 1 l. per kg. of soil. The total loss in org. matter after 6 months fluctuated from 10 to 14.5% in terms of C. The limed soils from the unleached pots lost from 5 to 8% more than the unlimed soil. The same tendency of losing org. matter upon the addn. of lime was noted when the lupine was added without any preliminary treatment. On a highly unsat'd. soil from pine forests lime (0.5% $CaCO_3$) without horse manure inhibited decompn. of org. matter. Higher amts. of lime (1% $CaCO_3$) increased the decompn. of org. matter. When the soil without manure was leached the addn. of 0.5% $CaCO_3$ increased the decompn., 1% decreased it. With manure (0.4% C) the 0.5 and 1% $CaCO_3$ decreased the decompn. of org. matter. With an increase of $CaCO_3$ the org. matter decompn. also increases. In the second part of the work T. discussed his expts. on the power of the sesquioxides to absorb nitrates chemically. He also showed that lime addns. in certain cases increased the absorption capacity of the soil. J. S. JOFFE

Disintegration of cellulose in soil. CHR. BARTHEL. *Svensk Kem. Tids.* 39, 221-32(1927).—An address. A. R. ROSE

Effect of some electrolytes on kaolin and the probable relation to the soil. J. R. SKEEN. *Soil Science* 23, 225-42(1927).—A study was made of the effect of electrolytes upon the turbidity, vol. of sediment, degree of adsorption of electrolytes, and rate of migration of particles of chemically pure kaolin. S. believes that the results apply to clays in general, and advances a theory for the formation of hardpan. R. B.

Mechanism of buffer action in soils. P. B. MYERS AND G. M. GILLIGAN. *Science* 66, 302(1927).—Results obtained with pectin solns. opened the way for a similar attack on soils in which an attempt is now being made to attribute the buffer action exhibited by certain soils to the impurities held by the colloidal fraction. It is hoped that sufficient data may be accumulated to substantiate the claim that buffer action peculiar to soil types laden with colloidal material is not due directly to the colloidal properties of the soil but rather to the salts, metallic or acid radicals that are held by the colloidal fraction. Cf. C. A. 21, 3697. E. F. SNYDER

Effect of mulches on soil temperatures. ALFRED SMITH. *Hilgardia* 2, 385-97(1927).—Mulch papers of a dark color averaged from 5° to 10° F. warmer in the daytime and from 0° to 5° F. warmer at night than unmulched plots. Light colored or perforated mulch papers showed no material effect in increasing the soil temp. beneath them. CARL R. FELLERS

The effect of calcium cyanamide on soil reaction. J. PIEN. *Compt. rend.* 185, 220-2(1927).—In expts. on a series of soils $CaCN_2$ caused a progressive increase in alky. during the 1st 5-10 days, followed by a gradual decrease. The final result was, however, a distinct change in the pH toward alky. The degree and rapidity of these changes were greater in soils rich in colloids (particularly humus) than in poor soils. P. R. D.

The oxidation of sulfur in alkali soil and its effect on the replaceable bases. C. D. SAMUELS. *Hilgardia* 3, 1-26(1927).—A careful review of previous investigations is given. No relation was found between decompn. of carbonates or formation of sulfates taking place during S oxidation in alk. soils. Addn. of H_2SO_4 to soil caused an increase in sol. Na and K with decreased Na_2CO_3 . Approaching complete neutrality of Na_2CO_3 , the concn. of Ca and Mg increased. H^+ was more active in replacement than Ca^{++} , H_2SO_4 proving more efficient in neutralization than $CaSO_4$. The presence of $CaCO_3$ was found desirable in the reclamation of soil with S. In tank and field expts. in which the greater part of the alky. of the soil was neutralized by the addn. of S, there were striking improvements in crop yields. The presence of $CaCO_3$ is very desirable in the reclamation of an alk. soil by means of S. CARL R. FELLERS

Calcium phosphorite from Istum and the plants in soils at various degrees of humidity. M. YEGOROV. *Ukrainskii Khim. Zhurnal* 2, 40-9; *Chem. Zentr.* 1926, II, 487.—A high degree of moisture in the soil increases the activity of phosphorite from the Istum deposits. Phosphorite behaves like $CaHPO_4$. For barley, its action reaches an optimum when the soil contains 80% H_2O . A. L. HENNE

Available phosphoric acid in soil. WRANGELL AND MEYER. *Landw. Jahrb.* 63, 739-75(1926).—Neubauer's seedling method (*Mitt. deut. Landw.-ges.* 47, 596(1923); cf. C. A. 18, 2933) of obtaining the P_2O_5 requirement of soil is compared with Wrangell's colorimetric method (C. A. 21, 2857). The former has many variables compared to

the latter. P_2O_5 concn. varies with the H_2O content. Change in P_2O_5 concn. with H_2O is a result of liberation of absorbed phosphates.

GEORGE R. GREENBANK

Modifications in the solubility of phosphoric acid and the biological properties of soil on leaving fallow after preliminary drying in the open air. A. N. LEBEDYANTZEV. *Compt. rend.* **185**, 397-9(1927); cf. 2 following abstracts.—Expts. in which soil was air dried and then left fallow at approx. 30% moisture and ordinary temp. showed that desiccation has a prolonged effect on the P_2O_5 and the no. of bacteria. The quantity of water-sol. P_2O_5 , markedly increased by drying, was again as low as that in the undried soil after 25 days and did not increase subsequently. However, the P_2O_5 sol. in $AcOH$ and $(COOH)_2$ showed a marked increase in the previously dried soil over quite a long period. The bacterial count, diminished by the preliminary drying, remained lower during 2-3 months; but the intensity of activity, as shown by CO_2 production, was distinctly greater in the desiccated soil.

P. R. DAWSON

Modifications in the solubility of phosphoric acid and the biological properties of soil on leaving fallow after preliminary drying in the open air. A. TH. SCHLOESING. *Compt. rend.* **185**, 399-400(1927); cf. preceding abstr.—Remarks are made on the differences in results obtained by Lebedyantzев and by Schloesing and Leroux (*C. A.* **21**, 2162). Explanation in part is sought in differences in soil types used and in analytical methods.

P. R. DAWSON

Modification of nitrogenous substances in soil dried in the open air and then left fallow. A. LEBEDYANTZEV. *Compt. rend.* **185**, 293-5(1927); cf. *C. A.* **18**, 1726.—Samples of soils, thoroughly dried in the air, were brought to a moisture content of 33%, spread out in 10-cm. layers and kept at 15-20° and approx. const. moisture for 6 months. Comparisons were made with samples of the same soils not previously dried. The soils subjected to preliminary drying were distinguished from those not dried by a more marked accumulation of nitrate, progressing throughout the expt. The ammonia N, which increased abruptly as a result of desiccation, diminished during the 1st 2 months, then increased again and remained at a high level for 4-5 months.

P. R. DAWSON

The reaction to desiccation of different soil types in the tchernozem and podsol zones of European Russia. A. LEBEDYANTZEV. *Compt. rend.* **185**, 568-9(1927); cf. *C. A.* **18**, 1726 and preceding abstr.—Positive reaction to desiccation was observed in all transition types of soils from scarcely degraded tchernozem to highly podsolized clay soils. Of the podsol soils, those in fallow gave a greater reaction, as was the case with tchernozem.

P. R. DAWSON

Use and action of the phosphates on black soil. III. Dynamics of the CaO and iron oxide + alumina (contents) of the soil, and the conditions influencing them. M. YEGOROV and F. MACKOV. *Ukrainskii Khim. Zhurnal* **2**, 7-37; *Chem. Zentr.* **1926**, **11**, 486-7.—A study of the humidity, the porosity, the water-sol. amt., the CaO and sesquioxide content of a black soil at various times in the day and the year, and at various depths. The porosity, *i. e.*, the proportion of air in the total volume ranges between 49 and 55%. The water soluble content increases with the humidity of the upper layer (0 to 2 cm.); it decreases in the deeper layer (15 to 20 cm.). The Al_2O_3 + Fe_2O_3 content decreases when the CaO content increases. The maximum of the soluble Ca content occurs during the hottest hrs. for the upper layer, in the evening time for the deeper layer. An increase in the temp. (17° to 34°) reduces the quantity of water sol. Ca ; an increase of the humidity of the soil increases it.

A. L. HENNE

The reversion of nitrates in the soil under cultural conditions in Mauritius. W. CRAIG and F. GIRAUD. *Bull. Dept. of Agriculture Mauritius; Intern. Sugar J.* **29**, 420-7(1927).—The addn. of large quantities of molasses causes the arrest of nitrification. Nitrates are converted into less available forms when large quantities of org. matter are present. Molasses causes the greatest loss in nitric N, dried green manure and dried farmyard manure following in the order named. Neither of the first 2 substances appears, however, to cause any loss of gaseous N, but with farmyard manure the losses of this kind are quite large.

W. L. OWEN

Ammonification in red prairie soils. H. F. MURPHY. *J. Am. Soc. Agron.* **18**, 177-83(1926).—There was increase in ammonification when CaO or $CaCO_3$ was used on either Vernon or Kirkland soil. Manure as a rule caused no greater increase than did lime, and in some cases it seemed to have a depressing effect. Heavy applications of lime produced more NH_3 than light applications and CaO was more favorable toward ammonification than $CaCO_3$.

F. M. SCHERTZ

Studies of the removal of nutrients from subsoil by alfalfa. C. E. MILLAR. *Soil Science* **23**, 261-70(1927).—Plants enclosed in glass cylinders 2 in. in diam. and 8 in. long in order to exclude roots from the surface soil grew as well as the controls and showed increased growth when nutrient solns. were applied at depths of 36 and 60 inches. Con-

trols did not show the same response to nutrients applied in the subsoil. The ability of alfalfa to absorb from the lower soil horizon is shown (1) by the development of fibrous roots in the region where nutrients were applied, and (2) by the fact that plants enclosed in dry quartz sand to a depth of 15 in. showed no wilting. R. BRADFIELD

Fertility of the soil as related to the forms of its iron and manganese. P. H. BREWER AND R. H. CARR. *Soil Science* 23, 165-73(1927).—Evidence of soil toxicity similar to that described for other soils high in Fe and Mn was noted in a Scottsburg (Ill.) yellow clay. Analysis of the soil showed that the Fe present was mostly ferric, and that most of the Mn was MnO_2 . The fact that the toxicity of such soils is reduced by manures but not by commercial fertilizers is believed to be due to the fact that Fe and Mn are reduced to more sol. forms by the rotting manure. The nature of the color changes observed when manganiferous soils are treated with KSCN soln. is discussed. R. BRADFIELD

A study of the factors influencing the efficiency of different forms of nitrogen as related to soil type and cropping system in the Atlantic coastal plain region. I. A. M. SMITH. *Soil Science* 23, 137-64(1927).—The optimum soil moisture for nitrate production was 50 to 60% of the water-holding capacity for Norfolk sandy loam. Urea and $(NH_4)_2SO_4$ nitrified more rapidly and gave higher nitrate accumulations than fish or tankage. Within the range studied nitrate production from all fertilizers increased directly with rise in temp. At all temps. urea gave the most rapid nitrification, and $(NH_4)_2SO_4$ the highest ultimate accumulations. When both nitrate production and rate of nitrogen accumulation are considered, the materials employed ranked as follows. $NaNO_3$, urea, $(NH_4)_2SO_4$, fish, tankage, activated sludge. An extensive bibliography is appended. R. BRADFIELD

Potassium content of plants as an indicator of available supply in soil. J. W. AMES AND R. W. GERDEL. *Soil Science* 23, 199-224(1927).—Neubauer's seedling method was employed to ascertain whether the K abstracted by plants is a reliable indicator of the K available in the soil. Wheat seedlings produced more plant material in a 20-day period and abstracted more K than either buckwheat or rye and therefore were used as the test plant. They responded to addns. of available K with increased growth and increased K content. The amt. of K abstracted was greater from soils which had been treated with fertilizers and manures. The wheat-seedling method did not, however, indicate as great a deficiency of K as chem. tests and decreased corn yields in the field. R. BRADFIELD

Outgo of calcium, magnesium, nitrate and sulfate from high-calcic and high-magnesian limes incorporated in two soil zones. W. H. MACINTYRE. *Soil Science* 23, 75-97(1927).—Results are reported from 4-yr. lysimeter studies, in which either the surface or the subsurface zone was treated with equiv. quantities of CaO , $Ca(OH)_2$, burnt dolomite, and $CaO-MgO$ mixt. The outgo of Ca was greatest during the first yr. with progressive decrease thereafter for both zones of incorporation. The Mg outgo from surface-zone incorporation of $CaO-MgO$ was greater during the 1st yr. but during succeeding yrs. the same as in the controls; in subsurface-zone incorporations, however, the Mg outgo was greater in all 4 yrs. than in the controls. The total Ca-Mg outgo was similar from all three limes used. The annual outgo was 5 times as great from subsurface incorporations as from surface incorporations. The Ca-Mg ratio in the leachings from $CaO-MgO$ applications varied with the zone of incorporation. Upper-zone leachings carried twice as much Ca as Mg, whereas lower-zone leachings carried twice as much Mg as Ca. The increase in nitrate and sulfate outgo was appreciable during the first year only. It was comparable for all limes, and for both zones of incorporation. R. BRADFIELD

Soil acidity and the growing of sugar beets. W. G. OGG. *Scottish J. Agr.* 10, 224-5(1927).—The reactions of 50 Scottish soils were compared with the yield of sugar beets obtained from them. The majority of cases of crop failure occurred on strongly acid soils and the best yields were obtained on soils having little or no acidity. The subsurface layers in the majority of soils examd. from south-east Scotland were less acid than the surface layers but in a no. of cases the reverse was true. This gave a possible explanation of the check that sometimes occurred in the normal healthy growth of beets that had made a good start. K. D. JACOB

The microflora and the productivity of leached and non-leached alkali soil. J. E. GREAVES. *Soil Science* 23, 271-302(1927).—Untreated soils, natural alkali soils, and soils treated with alkali were leached, and later fertilized or inoculated and cropped. The soils were sampled and analyzed for numbers and kinds of microorganisms before and after all treatments. The addn. of Na salts to soils decreased the bacterial count to a value between untreated and natural alkali soils. Leaching increased the bacteria

of all soils above normal. The greatest increase was in the natural alkali soils, indicating that leaching removed some factor which limited bacterial growth. Nitrification was low after leaching but was increased by both soil ext. and manure. Leaching and treatment with org. manures or inoculating are necessary to restore alkali soils to high productivity.

R. BRADFELD

The digestion of pectin and methylated glucoses by various organisms. H. W. COLES. *Plant Physiology* 1, 379-85(1926).—Only those organisms commonly occurring in the soil are capable of attacking pectin and 3-monomethyl glucose with the production of acid and gas. Pectin and the methylated glucose examd. were not digested with the production of acid or gas by the colon typhoid group of organisms commonly found in feces nor by organisms isolated from the activated sludge of creamery wastes. *Bact. schotmulleri*, *Bact. aertrycke* and other closely related forms cannot be differentiated on the basis of the digestion of pectin and the methylated glucoses examd. W. T.

The existence of daily changes in the bacterial numbers in American soil. H. J. THORNTON AND R. A. FISHER. *Soil Science* 23, 253-9(1927).—A statistical analysis of variations in daily bacterial count at Washington, D. C., indicates that the fluctuations observed are too great to be accounted for by unequal distribution of bacteria in a soil or by seasonal changes, since significant positive correlation between simultaneous samples was obtained with all media used.

R. BRADFELD

Growth of young wheat plants in auto-irrigated soils, as related to the water-supplying power of the soil and to the adjustment of the auto-irrigator. B. E. LIVINGSTON, TAKEWO HEMMI AND J. DEAN WILSON. *Plant Physiology* 1, 387-95(1926).—Description of preliminary greenhouse expts. in 3 different soil media having water-holding capacities of 39.2, 60.7 and 95.1%, resp., to det. the relationship between the growth of young wheat plants in Livingston auto-irrigated pot-cultures and the water-supplying power of the soil about their roots. The water-supplying power of the soil was detd. by the soil point method (cf. *C. A.* 14, 3697), each soil series being in equilibrium with a hydrostatic head of 2, 10, 20, 30 and 40 cm. of Hg, resp. Conclusion: Although growth of the plants was profoundly influenced in some cases by some variable or variables other than the water-supplying power of the soil, this latter factor was, in general, of primary importance in detg. the growth of the plants under the conditions of the expts.

WALTER THOMAS

Relation of the yield and protein content of wheat to the nitrogen content of the soil under ten years of different systems of cropping. R. E. NEIDIG AND R. S. SNYDER. *Idaho Sta. Research Bull.* 5, 3 32(1926).—Under the conditions at Moscow, Idaho, the protein content of wheat is increased by applications of manure. Summer fallowing always increased the available N in the soil and the protein content of the wheat crop following but the latter, although high, was further increased in the crop from plots that were manured. The N/C ratio was higher in the grain from manured than from unmanured plots in all of 8 diff. rotation systems. Manure causes a better utilization of H₂O by the growing crops as shown in higher increases in yield produced during seasons of insufficient rainfall. None of the rotation systems without manure maintained the N and org. matter content of the soil at as high a level as it was at the beginning. Summer fallowing considerably reduces the org. matter and increases the availability of plant foods, especially N in this soil, and causes greater erosion. Crop for crop total foods are more rapidly depleted by fallowing one year in every three than by cropping every year with a suitable rotation. The range of total N and org. C content of the unmanured plots was 0.152-0.170 and 1.41-1.74%, resp. The av. protein content of the wheat from the various expts. ranged from 12.03 to 15.05%.

A. L. MEHRING

The problem of the manufacture of ammonium phosphate as a fertilizer. S. I. POZDNYAKOV. *J. Chem. Ind. (Russia)* 2, 757-8; *Chem. Zentr.* 1926, II, 2839.—Analyses of 2 grades of the American fertilizer "Ammophos" gave in %, resp.: NH₄H₂PO₄ 61.1, 27.9; (NH₄)₂HPO₄ 11.3, 5.8; (NH₄)₂SO₄ 3.7, 57.3; Ca₃PO₄ 2.5, 0.5; (Al, Fe)PO₄ 6.6, 5.5; CaSO₄·2H₂O 3.7, 5.5; CaSiO₃ 0.4, 0.4; insol. residue 5.6, 1.5; water 1.5, 0.4. This compn. shows that this fertilizer can be produced in Russia.

C. C. DAVIS

The production of synthetic nitrogenous fertilizers. H. M. NAGANT. *Sci. Agr.* 7, 401-6; 8, 451-60(1927).—An excellent review of all the important chem. processes of N-fixation with reactions and discussion. Appended are 13 references to the literature.

CARL R. FELLERS

Fertilizer analyses made at Pasoeroean (Java) during the years 1914 to 1926. C. H. VAN HARREVELD-LAKO. *Arch. Suikerind.* 35, 835-50(1927).—Analyses of a variety of fertilizer materials, made according to the Dutch or German official methods, are tabulated and commented upon.

F. W. ZERBAN

The reduction of mineral phosphate by biological methods. K. I. RUDOKOV.

Centr. Bakt. Parasitenk. II Abt. 70, 202-14(1927).—When to a medium consisting of cond. water 1000 cc., mannitol 20 g. and $(\text{NH}_4)_2\text{H}_2\text{PO}_4$ 2 g. a small amt. of soil is added, much of the phosphoric acid is quickly reduced to H_3PO_3 and H_2PO_3 and to phosphine.

JOHN T. MYERS

Can the urea in manure become harmful to plants? OSCAR LOEW. *Centr. Bakt. Parasitenk. II Abt.* 70, 39-41(1927).—If urea-splitting bacteria are absent, the urea in manure may interfere with chlorophyll formation or even cause the death of the plant.

JOHN T. MYERS

Kale fertilizers. H. H. ZIMMERLEY AND M. M. PARKER. Virginia Truck Expt. Sta., *Bull.* 54, 467-76(1926).—The relative values of certain ammoniates when used in top-dressing fertilizers for the kale crop were compared. The N sources compared were NaNO_3 , $(\text{NH}_4)_2\text{SO}_4$, animal tankage, Leunasalpeter and urea. NaNO_3 , $(\text{NH}_4)_2\text{SO}_4$, Leunasalpeter and urea proved equally efficient as sources of N in kale top-dressing fertilizers.

E. F. SNYDER

The inter-relation between silicon and other elements in plant nutrition. W. E. BRENCHELEY, E. J. MASKELL AND K. WARINGTON. *Ann. Appl. Biol.* 14, 45-82(1927).—Sol. silicate has little effect on the growth of barley if P is present, whereas in the absence of P a significant increase in dry wt. of the plant is induced by silicate. The effect is also shown in the increase in height of the main shoot, and increase of leaf development. A close assocn. exists between the amt. of P present and the effect of silicate upon the rate of tillering and no. of tillers produced. Sol. silicates are more active than glass silicates. Variations in response of barley and mustard to silicate on different types of soil were noted. Improvement occurred with increasing doses of silicate accompanied by various combinations of fertilizers especially when P or K was deficient. The results are examined statistically.

C. H. RICHARDSON

Results of experiments on the experimental plot at Ljuberstzk. A. H. VOL'SKII. *Trans. Inst. Fertilizers Lief.* 30, 86-104(1925); *Chem. Zentr.* 1926, I, 2041.—On sandy loam, with an adsorption capacity of 0.06-0.09 CaO acidity of 0.02 CaO per 100 g. of dry soil, the most advantageous quantity of CaCO_3 economically to be added is 7500-9000 kg. per hectare. The addn. of CaCO_3 also increases the favorable action of stable manure. Rye, oats and vetch were used for the expts.

C. C. DAVIS

The cycle of phosphorus in nature. M. YEGOROV. *Ukrainskii Khim. Zhurnal* 2, 71 9, *Chem. Zentr.* 1926, II, 2439.—Stable manure gradually loses P into the air. By drawing air through a mixt. of manure and water, 0.1 of the P in the manure was carried away in 3 days, and the P compds. were recovered from the air by adsorption on activated C. The quantity of P introduced into the air by this method is nearly as much as the quantity of P obtained by pptn. from the air on the earth.

C. C. D.

Liming of pastures. Initial results of experiments in Auckland. T. H. PATTERSON AND J. W. WOODCOCK. *New Zealand J. Agr.* 34, 389-94(1927).—Field expts. carried out in the Pukekohe district, N. Z., over a no. of years indicated that basic slag and ground rock phosphate are better fertilizers for pasture than superphosphate, apparently on account of the high Fe content of the soil.

K. D. JACOB

Some effects of calcium compounds on the soil and on plant growth. W. T. H. WILLIAMSON. *Scottish J. Agr.* 10, 180-4(1927).—The effect of CaCO_3 , CaCl_2 , mineral phosphate and superphosphate on the acidity and exchangeable Ca content of a soil deficient in the latter was studied in plot expts. Mineral phosphate reduced the acidity and increased the exchangeable Ca content but not to as great an extent as CaCO_3 . Heavy applications of superphosphate, 8.75 to 12.5 tons per acre, gave an immediate increase in soil acidity which persisted for about 6 months. The soil was finally no more acid than the untreated soil and the exchangeable Ca content was greatly increased. With CaCl_2 at the rate of 12.5 tons per acre the acidity of the soil was immediately increased to a considerable extent and then slowly decreased until after 1 year it was no more acid than the untreated soil. The exchangeable Ca content was considerably increased. The immediate effect of such heavy applications of CaCl_2 was to destroy practically all forms of vegetation but after 1 year the plots produced crops of barley which, in some cases, were as good as those obtained from plots receiving heavy applications of CaCO_3 . The investigations are being continued.

K. D. JACOB

The influence of calcium carbonate on the soil. A. A. RODE. *Izvestia Leningrad. Lesnogo Instituta* 34, 119-80(1927).—R. deals with the problem of the influence of Ca additions on the decompn. of org. matter. Podsol soils which contained high quantities of C (12.86%) and highly unsatd. (0.02842 g. of H ions per 100 g. of soil as detd. by the BaCl_2 method) were used. Chernozem soils (1.97% C) were treated with 0.05 N HCl to make it unsatd. and then treated with CaCO_3 . In the podsol soils the unsatd. equalled 0.6252 g. CO_2 per 100 g. of soil; in reality 1.43 g. of CO_2 was liberated

from the soil upon the addn. of CaCO_3 . This is due to the decompn. of org. matter. As the quantities of CaCO_3 were increased the liberation of CO_2 decreased after a certain period of incubation. The explanation is that in the beginning the Ca neutralizes the excess of acid (unsatn.); this disturbs the equilibria (chemical and biological) and the org. substances not capable of decompn. at the acid reaction begin to be decomposed upon the addition of CaCO_3 ; a new equil. is reached whereby the Ca ions decrease the dispersion, and decompn. ceases. This was corroborated with the chernozem soil; in the artificially unsatd. chernozem the process was similar to the podsol soil; in the normal chernozem the addn. of lime had no influence on the decompn. of org. matter. Excess of CaCO_3 increased the capacity for base exchange. The author refers to the work of Tyulin and Askaniy.

J. S. JOFFE

The influence of boron on the growth of the soy-bean plant. J. H. COLLINGS. *Soil Science* 23, 83 105(1927).—An intensive investigation was made of the effect of B in the form of H_3BO_3 and K and Na borates upon the germination and growth of soy beans in sand, soil and soln. cultures. Germination was retarded by 10 mg. B per l. and prevented by 250 mg. per l. Applications of 1 lb. B per acre produced visible toxicity in sand and soil cultures. In nutrient solns. 0.1–0.2 mg. B per l. caused brown spots on the leaves. In all the expts the effects of the diff. carriers of B seemed to be identical. In no case was any marked stimulation observed during the seedling stage, although some was noted when the plants were grown to maturity in soln. cultures contg. 2.5 mg. B per l. Normal mature soy bean plants were obtained, however, without the application of B.

R. BRADFELD

The effect of fertilizing conditions on the nutritive and vitamin values of millet and wheat. R. MCCARRISON AND B. VISWANATH. *Indian J. Med. Research* 14, 351–78 (1926).—Soil fertilized with farm yard manure yielded millet or wheat of higher nutritive value than the same soil fertilized with a complete mineral fertilizer or soil not fertilized for years. This difference seems to be in the vitamin content of the grain.

FRANCES KRASNOW

Experiments, of the nature of a survey, on the stimulant action of certain salts on the growth of grains. HUGO KAHN. *Acta Comment. Univ. Dorpatensis* 8, A VIII, 7, 17 pp.(1925); *Chem. Zentr.* 1926, II, 237.—It is attempted through systematic expts. to do away with the confused ideas about growth stimulation which have up to the present prevailed. Wheat grains were treated with a large no. of neutral salts, chiefly K salts, which are known to promote swelling. Salts of heavy metals and salts of the alk. earths were also tested. Pure water served as control, and in most cases had by far the most favorable effect. Next to water came the K salts, with which the nature of the anion did not play a decisive part in the action. The alk. earth salts and salts of heavy metals showed, with the exception of Mn salts, practically no stimulating influence on growth. When mixts. of K salts and other salts were used, there was almost always a retarding effect on the swelling.

C. C. DAVIS

Stinking-smut of wheat. V. Summary of three years' experiments on control and detailed results for 1926–27 season. J. C. NEILL. *New Zealand J. Agr.* 35, 28–34(1927); cf. *C. A.* 20, 3329.—Cu carbonate dust gave satisfactory control but produced 4% fewer heads of wheat than from the same wt. of untreated seed. Clarke's Wheat Protector, CuSO_4 1% soln., and formalin 1 part to 480 parts of soln., gave good control but caused decreases in yield of 17, 20 and 18%, resp. CuSO_4 2% soln. and formalin 1 to 320 soln. decreased the yields of wheat 24 and 27%, resp. The mercurio-phenol preps., Semesan, Uspulun and Germisan, gave good but not complete control of smut and in general caused a slight increase in the yield of wheat. All of the treatments were successful in 1 or 2 of the seasons but none gave complete control in all 3 seasons. In expts. during one season "colloidal Cu" gave results similar to Cu carbonate.

K. D. JACOB

Hot-water treatment of seed barley. C. H. HEWLETT. *New Zealand J. Agr.* 34, 409–12(1927).—Barley smut was completely controlled by pre-soaking the seed 5–6 hrs. at 78° F. followed by dipping for 5 min. at 127° F. The treatment delayed germination of the seed but the final percentage germination compared favorably with that of the untreated seed.

K. D. JACOB

Recent investigations on contact insecticides. F. TATTERSFIELD AND C. T. GIMINGHAM. *J. Soc. Chem. Ind.* 46, 368 72T(1927).—See *C. A.* 20, 2558; 3769 and following abstr.

E. F. SNYDER

Studies on contact insecticides. V. The toxicity of the amines and N-heterocyclic compounds to Aphis rumicis L. F. TATTERSFIELD AND C. T. GIMINGHAM. *Ann. Appl. Biol.* 14, 217–39(1927); cf. *C. A.* 20, 3769.—Quant. expts. show that $(\text{CH}_3)_2\text{N.OH}$

and $(\text{CH}_3)_4\text{N}.\text{Cl}$ are more toxic to this aphid than the corresponding $(\text{C}_6\text{H}_5)_4\text{N}$ compds. Aromatic amines show little toxic action but the substitution of aromatic groups in the NH_2 group of $\text{C}_6\text{H}_5\text{NH}_2$ results in a greater increase in toxicity than the substitution of aliphatic groups. The following orders of toxicity were observed in the aromatic amines: $\text{C}_6\text{H}_5\text{NH}_2 < (\text{C}_6\text{H}_5)_2\text{NH} > (\text{C}_6\text{H}_5)_3\text{N}$; $\text{C}_6\text{H}_5\text{NH}_2 < \text{C}_6\text{H}_5\text{NHC}_6\text{H}_5 > (\text{C}_6\text{H}_5\text{CH}_2)_2\text{N} < \text{C}_6\text{H}_5\text{CH}_2\text{NH}_2 < (\text{C}_6\text{H}_5\text{CH}_2)_3\text{N}$. *o*-Nitroaniline is one of the most toxic of the $\text{C}_6\text{H}_5\text{NH}_2$ derivs. $\alpha\text{-C}_{10}\text{H}_7\text{NH}_2$ is more toxic than $\text{C}_6\text{H}_5\text{NH}_2$ but substitution of various radicals into the NH_2 group of the latter compd. has a greater effect on toxicity of the resulting compd. than the same substitution into $\alpha\text{-C}_{10}\text{H}_7\text{NH}_2$. The order of toxicity of the simpler N-heterocyclic compds. is: pyrrole < pyridine < picoline < lutidine < quinoline and isoquinoline < acridine. Hydrogenation of pyridine and pyrrole increases their toxicity, piperidine being more toxic than pyridine and pyrrolidine more toxic than pyrrole. Benzylpyridine was the most toxic pyridine deriv. investigated. The toxicity of nicotine is discussed. VI. The insecticidal action of the fatty acids, their methyl esters and sodium and ammonium salts. *Ibid* 231-58.

The fatty acids from HCOOH to stearic acid, their Na and NH_4 salts and their Me esters have been examd. with respect to their toxicities to an aphid (*Aphis rumicis*). The unsatd. acids, undecenoic and oleic, were also included. Toxicity increases with increase of mol. wt. from CH_3COOH to undecylic acid, HCOOH being exceptional. Beyond undecylic acid a fall in toxicity occurs, acids in the series higher than tridecylic showing only slight toxic action. The Na salts are generally less toxic than the corresponding acids, the difference being less marked with the higher acids. Oleic acid and Na oleate are of equal toxicity. The NH_4 salts are generally less toxic than the corresponding acid but the differences are much less marked than with the Na salts. NH_4 metastate, NH_4 oleate and some others are more toxic than the corresponding acids. The increased toxicity probably results from the fact that upon hydrolysis the free acid is liberated in a very finely divided state. Methylation of the fatty acids reduces their toxicity, all the Me esters being less toxic than the acids or NH_4 salts. The NH_4 salts and Me esters show increased toxicity with increase of mol. wt., the formates being exceptional. Fatty acids at concns. below 2% are not markedly toxic to the eggs of *Selenia tetralunaria*. Possible relationships between toxic action and the phys. state of the compds., volatility, dissoen. consts., partition coeffs. and surface tension are discussed. A steady rise in toxicity with decrease in partition coeffs. (water/oil) from CH_3COOH to caproic acid was noticed and is discussed. HCOOH again was exceptional. Methods are described. Cf. preceding abstr. C. H. RICHARDSON

Simple and rapid methods for determining the active ingredients of fungicides and insecticides. III. Titrimetric determination of polysulfide sulfur. J. BOBŇAR and WILHELMINE GERVAY. *Z. anal. Chem.* 71, 446-58(1927); cf. *C. A.* 21, 622.—A description of the various methods for the analysis of polysulfides is given and the results of comparative tests made with 4 volumetric methods and 1 gravimetric method are shown. On the whole, E. Schulek's method proved the most satisfactory volumetric method. It depends upon the formation of alkali thiocyanate by treatment with alkali cyanide in the presence of boric acid and iodometric titration of the thiocyanate. W. T. H.

The residual insecticidal action of lubricating oil sprays on the pear psylla. W. A. ROSS. *Sci. Agr.* 7, 395(1927).—Oil sprays, in addn. to destroying large nos. of adults, have a very important residual insecticidal action, to a very marked extent then prevent egg laying. It is this residual action, which no doubt explains why lubricating oil sprays have given much cleaner-cut results in psylla control than other contact insecticides such as nicotine sulfate. CARL R. FELLERS

The influence of ammonium sulfate as a direct source of nitrogen for apple trees. M. B. DAVIS. *Sci. Agr.* 8, 41-55(1927).—N in the form of $(\text{NH}_4)_2\text{SO}_4$ is not available for apple trees. As soon as nitrifying organisms are present in the substratum the $(\text{NH}_4)_2\text{SO}_4$ series appeared to give about as good growth response as did NaNO_3 . When applied in quantities which appear to be above the optimum concn., toxicity decreased in the order named: cyanamide, $(\text{NH}_4)_2\text{SO}_4$, NaNO_3 , indicating that under conditions where nitrifying bacteria are not present, NaNO_3 is less dangerous than either of the other 2 N compds. It appears that $(\text{NH}_4)_2\text{SO}_4$ becomes available on a very poor sand when nitrifying organisms are present. CARL R. FELLERS

A preliminary study of petroleum oil as an insecticide for citrus trees. E. R. DE ONG, HUGH KNIGHT AND J. C. CHAMBERLAIN. *Hilgardia* 2, 351-84(1927).—Petroleum oils in relation to their availability as insecticides for use on citrus trees were investigated. Non-viscous oils of low b. p. such as the kerosenes are safer to use on the tree than those of higher b. p., but are unsatisfactory as scalecides because of rela-

tively low toxicity combined with high volatility. Highly refined white lubricating oils are most advisable for use in summer on citrus trees. Low-viscosity oils are safer to use on trees than high-viscosity oils because of the more rapid disappearance of the former. Severe injury to the trees is assocd. with a high % of unsatd. hydrocarbons. Filtration of oil through fuller's earth is ineffective. A quick-breaking emulsion utilizes to the max. degree the insecticidal agent. Non-volatile lubricating oil, 2%, with 98% H₂O as a carrier was 100% effective in lab. tests on red scale. Stable oil emulsions using the same ingredients are ineffective against this scale in strengths of 4-8% actual oil. The quick-breaking action in an emulsion is greatest when the av. size of the dispersed oil globules is greatest, and that size is greatest when the proportion of emulsifier to oil is least. The insecticidal action of unrefined lubricating oils seems to consist of suffocation and toxic action. The former results from non-volatility (film permanence), the latter chiefly from the action of unsatd. hydrocarbons with unrefined petroleum oils or that of free fatty acids with vegetable oils. The lethal immersion period varied from a few sec. for the most toxic substance to 16 days for the least toxic. Volatility limits of oil range from a few min. or hrs. to several weeks. Cross symptoms of injury to citrus trees from the use of unrefined petroleum oils include defoliation, fruit spotting and dropping and the killing of twigs and branches. There is also apparent interference with the normal-plant functions of transpiration and respiration. Refining petroleum oil with H₂SO₄ removes the following injurious constituents: aromatics, olefins, resins and S.

CARL R. FELLERS

Chemicals in puncture vine control. ETHELBERT JOHNSON. *Monthly Bull. Calif. Dept. Agr.* 16, 354-5 (1927).—AsCl₃ destroys the underground stems of some species of creeping perennials. It is effective even in very dil. solns. in destroying the top growth of many annual weeds including puncture vine, if applied before the seeds mature. Vegetation sprayed with AsCl₃ is repulsive to grazing animals and they avoid it. Arsenite-sprayed vegetation, on the other hand, is very attractive to grazing animals and is so toxic that a few mouthfuls may cause death.

CARL R. FELLERS

The internal therapy of plants. ADOLF MÜLLER. *Z. angew. Entomologie* 12, No. 8, 1-206; *Chem. Zentr.* 1926, II, 2446. —The literature is discussed in great detail. To remove leaf lice, the cut sprigs were immersed in dil. alc. solns. and in solns. of chloral hydrate. The lice were killed by 5% alc. solns. without injury to the leaves, whereas a similar chloral hydrate soln. killed both lice and leaves. Expts. in the internal therapy of a no. of plants were carried out. The substances to be tested were injected, or the cut sprigs immersed in the solns. The solns., which were tested at various concns., included quinine chloride, quinine sulfate, EtOH, chloral hydrate, CuSO₄, colloidal Cu in the presence of NH₄OH, colloidal Ag in the presence of NH₄OH, colloidal Hg in the presence of NH₄OH, As₂O₃, *Segetan I* and a series of mixts. of various compds. whose ions were Cu and Hg in combination with various inorg. and org. anions. To combat the blood louse, alum, chloral hydrate, nicotine chloride and pyridine were used, and to det. what is tolerated by the individual plants, the latter were treated with solns. of H₂SO₄, HCl, HNO₃, NaOH, Al₂(SO₄)₃, MgSO₄, BaCl₂, KCl, NaCl, CuSO₄, Cu(OAc)₂, Zn(OAc)₂, HgCl₂, EtOH, HCO₂H, chloral hydrate, AcOH, PhOH and pyridine. The manner in which these compds. act upon the various parts of the plants is described in detail and compared with work of previous investigators.

C. C. DAVIS

Earwig control. H. C. LEWIS. *Monthly Bull., Calif. Dept. Agr.* 16, 469-71 (1927).—Poison bran baits said effectively to control the pests consist of NaF 1 lb., molasses 2 qts., H₂O 2 gal., wheat bran 16 lbs. Another improved bait is composed of wheat bran 5, sugar 2 1/2, meat meal 2 1/2 lb., and Paris green 10 oz.

C. R. F.

The control of glasshouse insects with calcium cyanide. H. W. MILES. *Ann. Appl. Biol.* 14, 240-6 (1927).—Expts. show that this compd. can be used to control greenhouse pests in Great Britain.

C. H. R.

Fertilizing in relation to the control of shot-hole borer of tea. F. P. JEPSON AND C. H. GODD. *Dept. Agr. Ceylon, Bull.* 78, 1-49 (1926).—Fertilizer treatments using N, K, P₂O₅ and lime had no direct effect upon beetles. A benefit was derived from the use of manures, however, for they served to accelerate the healing of galleries. Healing was most marked in plots treated with nitrogenous manures. Healing was complete in 2.9 months on N plots and not until 3.75 months in the control plot.

M. S. A.

Cauliflower production in California (JONES, ERNST) 11D. The fixation of atmospheric N as cyanide [use for combating plant vermin] (WÄSSER) 18. Preparation and mechanical treatment of phosphates (VERKHOVSKII) 18. Selective absorption of ions in colloidal clay (DEMOLON, BARBIER) 2.

Phosphatic fertilizers. B. BODREKO. Brit. 262,878, Sept. 22, 1925. Natural Ca phosphates are washed to remove carbonate, mixed with S, and maintained at 40–50° in app. such as silos or ovens in which they are treated with jets of steam. Other materials such as fresh bones, ground meat and dried and ground blood may be added.

Phosphatic fertilizers. L. ADELANTADO. Brit. 262,833, June 9, 1925. Natural phosphates contg. substantial quantities of Fe or Al, or mixts. of such phosphates with Ca phosphate (which may be rich in CaCO_3) are treated with a sulfate of an alkali metal or of NH_4 or Mg and with an acid such as H_2SO_4 or an acid salt to produce a neutral or very slightly acid product without heating. Various other fertilizing materials may be added such as peat, sewage sludge and org. factory or tannery wastes. Cf. C. A. 20, 2223.

Fungicide. K. BRODERSEN and W. FEXT. Can. 274,042. Sept. 20, 1927. A dry fungicide contains a halogenated addition product of a quinone with a phenol.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Influence of water containing sulfuric acid on the germinating power of steeped grain. J. DEHNICKE. *Z. Spiritusind.* 49, 336–7(1927).—After steeping and aeration grains were added to acidified H_2O . Varying amts. of H_2SO_4 were added to the batches. In a concn. of 0.049 g. H_2SO_4 per 100 cc. germination was normal. Above this amt. germination was diminished. Mold growth on grain is influenced by time of exposure and concn. of acid.

C. N. FREY

The function of diastase and its determination in the mash. F. WENDEL. *Z. Spiritusind.* 50, 9(1927).—The following method was developed by Ellrodt. Add 15 cc of 1% sol. starch to a stoppered vessel graduated to 15–20 cc. Add 5 cc. of the filtered mash, shake and suspend the flask for 1 hr. in a bath at 28°. Add 1 soln. and note color change. A yellow color indicates a large amt. of diastase, a red color a small amt. and a blue-violet disappearance of diastase.

C. N. FREY

Nitrogen for yeast in fermenting corn and potato mashes. J. DEHNICKE and W. KILP. *Z. Spiritusind.* 50, 202–4(1927).—These expts. indicated that org. N, such as asparagine or malt exts. should be added to corn mashes. During the initial mashing period temps. of 48–52° should be maintained, but during later stages the temp. should be allowed to rise to 60°.

C. N. FREY

The utilization of fusel oils. E. LÜDDE, B. LAMPE and W. KILP. *Z. Spiritusind.* 50, 245–6, 255(1927).—By the use of modern distg. app. alc. of high degree of purity is produced. The slop contains a large amt. of fusel oil and consequently it is unfit for feeding purposes. By means of a fractionating column fractions were withdrawn at various temp. levels and analyzed. It was found that the official method did not give reliable results for detg. Am alc. or the other high-boiling fractions.

C. N. F.

The detection of fruit wine in grape wine. TH. RÖRTGEN. *Chem.-Ztg.* 51, 697–8(1927); cf. C. A. 21, 796.—The detn. of adulteration by means of ultra-violet light is not practical on account of the difficulty of obtaining a proper standard for comparison. When testing for adulterants by means of his reagent, their presence is not evident with some wines. In cases of this sort the proportion of reagent to wine is changed from 1:17 to 2:18, and the correct green color is then obtained. A new method consists of neutralizing wine with concd. NaOH and transferring to 25-cc. graduate. To 10 cc. of adulterated wine add 10 cc. of cold, satd. baryta soln., shake, and let stand. The ppt. is colored gray with a tinge of yellow with adulterated wine, and gray with a mixt. of red in the case of pure grape wine.

C. N. FREY

Estimation of methanol in alcohol and alcoholic beverages using the immersion refractometer. J. F. WILLIAMS. *Ind. Eng. Chem.* 19, 844–5(1927).—The method is based upon the refractive indices of the alcs. and the apparent total percentage of alc. as ethyl from the sp. gr., when a 20% soln. is used. When less than 1% methanol is present a set of colorimetric standards should be made. Acetone in traces does not affect the accuracy of the method.

C. N. FREY

The physiology of *Bacillus acidificans longissimus* (B. delbrücki) in connection with the possibility of utilizing it for the industrial production of lactic acid. V. SHAPOSHNIKOV and A. Y. MANTEIFEL. *Trans. Sci. Chem. Pharm. Inst.* 1923, No. 7, 3–23.—To obtain the max. amt. of lactic acid compds. in the medium it is necessary to add a neutralizing agent on the second day of inoculation. Fermentation proceeds until no sugars remain in the medium. The lactates found do not hinder the process and

by a continuous neutralization the vessel may be filled with the solid lactates. MgO , MgCO_3 or ZnO may be used. J. S. JOFFE

Color changes of beer during the primary fermentation. W. WANDERSCHNECK. *Wochschr. Brau.* **43**, 391-5, 403-8(1926).—The color of a wort becomes appreciably lighter during fermentation, but with bottom fermentation of the Pilsen types it becomes darker. This is said to be due to adsorption of color by yeast which later is redissolved. Air inhibits the action, but CO_2 accelerates it. Bottom yeast is more subject to this action than top yeast due to greater duration. Na_2CO_3 aids in improving the color. B. C. A.

Buffer substances in wort and beer. P. KOLBACH. *Wochschr. Brau.* **43**, 123-9, 135-40(1926); cf. *C. A.* **21**, 2355.— CO_2 plays a part in lowering p_{H} , in some instances from 5.87 to 5.15, and should not be removed when the test is made. Primary and secondary phosphate mixt. is most effective as a buffer at p_{H} 6 to 7.6. Primary and secondary phosphates counteract alky. The total buffer action is probably due to the above substances and to proteins, polypeptides and amino acids, but no definite statement can be made. C. N. FREY

Influence of hop constituents on head formation in beer. W. WINDISCH, P. KOLBACH AND W. BANHOLZER. *Wochschr. Brau.* **43**, 207 9, 217 23, 229-35, 241 6, 253-8 (1926).—Hop derivs. contribute more than any other constituent of beer to head formation. Length of boiling up to 3 hrs. has very little effect. Ether exts. all of the foam-forming constituents from hops, humulone being the most important element. Humulinic acid is a product of hydrolysis. The acid is more effective than its precursor. C. N. FREY

Influence of the brewing water on the acidity of the wort and beer. W. WINDISCH AND P. KOLBACH. *Wochschr. Brau.* **43**, 423 8, 444 7(1926).—With the addn. of CaSO_4 the H -ion concn is increased and the amt. of buffer diminishes. $\text{Ca}_3(\text{PO}_4)_2$ is pptd. The titratable acidity is not greatly changed. When MgCO_3 or Na_2CO_3 is added, the p_{H} is increased as well as the buffer material and titratable acidity. CaCO_3 decreases the H -ion concn., but not as greatly as Na_2CO_3 . Usually the amt. of buffer in the beer is less than in the original wort. B. C. A.

Measurement of foam in beer and the factors which influence it. K. GEYS. *Wochschr. Brau.* **43**, 439 44(1926).—The p_{H} and humulone are the factors governing foam in beer. The amt. of yeast used affects the p_{H} . Low p_{H} tends to coagulate the proteins. When the protein is peptized, little foam is formed and proper head retention is not obtained. B. C. A.

Resinification of the α -bitter acid of hops (humulone) by molecular oxygen. W. WINDISCH, P. KOLBACH AND J. YOFÉ. *Wochschr. Brau.* **43**, 349 53, 359-63, 369-72, 379-83(1926).—During boiling of hopped wort humulone is oxidized to resinous substances. During storage oxidation takes place, especially if O_2 and H_2O are present. When oxidized to 30-40% it becomes stable and further oxidation is difficult. In a dry state humulone is stable. Heating fresh hops drives off the volatile matters, such as hop oil, which accelerates oxidation of humulone and therefore aids in preservation. B. C. A.

The fermentation of the lambics. M. H. VAN LAER. *Bull. fed. ind. chim. Belg.* **6**, 357-65(1927).—The "lambic" is a kind of beer made exclusively in Brussels. Its fermentation is due to 3 kinds of ferments, i. e., *Saccharomyces* species, *Saccharomyces bruxellensis*, *Brettanomyces bruxellensis* and *Brettanomyces lambicus*, the 2 latter being of the same kind. The fermentation curves have been detd. in each case. The bouquet of the beer is due to *Bacillus bruxellensis*. *Bacillus viscosus bruxellensis*, often found in the "lambic," is in no way responsible for its fermentation; it transforms the sugars into lactic, acetic and butyric acids; it also attacks the substances contg. N. A. L. HENNE

Glassy malt. W. WINDISCH. *Wochschr. Brau.* **44**, 372(1927).—Glassy malt is due not to over moistening of the grain and drying at high temp. as formerly believed, but is caused by the lack of cyase action on a resistant cellulose. C. N. FREY

Constitution and determination of pectins and gums in wines and in grape musts. L. SEMICHON AND M. FLANZY. *Ann. fals.* **20**, 395-9(1927); cf. *C. A.* **20**, 3534; **21**, 1165.—The previously unidentified org. portion of the pectic nucleus has been found by qual. and quant. detns. to consist of glycerol and to be free from fatty acids or org. bases. Results obtained to date indicate that the pectin mol. consists of a pectic acid nucleus, esterified on the one hand by 1 or more OMe groups, on the other hand by glycerol, which itself is esterified as a glycerophosphate of Ca, Mg and a little Al. The ratio of Ca glycerophosphate to Ca pectate was found const. in freshly prepd. pectins; but pectins dried at 90° and kept for a few weeks or months show progressive trans-

formation. Previous detns. of MeOH in pectic acid, calcd. from the sapon. value, are considered inaccurate because of the simultaneous sapon. of the methylpectic, glyceropectic and glycerophosphoric esters. Gums and pectin are detd. as follows: to 100 cc. of must or wine add 1 cc. HCl and enough neutral 96–7% alc. to give a final concn. of 80% by vol., let stand till the supernatant liquid is quite clear (generally 24 hrs.), filter through a double tared filter, wash to neutrality with 80% alc., dry at 90° and weigh the gums and pectin; redissolve the ppt. in cold freshly boiled distd. water, add 20 cc. of CO₂-free 0.1 N KOH, boil 1 hr. under a reflux condenser, cool, acidify with AcOH to keep the P₂O₅ in soln., let stand 15 min., ppt. with 10% CaCl₂ soln., boil 15 min. under a reflux condenser to flocculate the ppt. without loss of AcOH, filter, wash and dry as above, and weigh as Ca pectate; ppt. the gums in the filtrate by means of 96 7% alc., and proceed as previously described for the pectin ppt. The Ca pectate ppts. obtained contained 6.39–6.53% Ca, av. 6.46%; whence the mol. wt. of pectic acid must be of the order of 581.

The detection of fruit wine in grape wine. M. RÜDIGER and W. DIEMAIR. *Chem.-Ztg.* 62, 597–9(1927).—The phosphomolybdic acid and NH₃ reagent, the aurosodium chloride and the reaction of Röttgen are discussed. It is concluded that there is at present no satisfactory method known for detg. adulteration of grape wine by fruit wine.
A. PAPINEAU-COUTURE
C. N. FREY

Sulfur dioxide in wine making: determining the amount to be added by the combination numbers of the sulfur dioxide with the wine constituents. L. MOREAU and E. VINET. *Ann. fals.* 20, 316–25(1927).—Addn. of SO₂ to must or wine up to a certain limiting value, designated as the total combination no., *T* (expressed in mg. per l.), results in its complete combination with aldehydes, etc. If a greater amt of SO₂ is added, the amt. remaining free after equil. has been reached is a practically const. fraction of the excess over *T*. It is designated as the residual SO₂ no., *R*, and is expressed as mg. free SO₂ per l., per 100 mg. SO₂ added per l. in excess of *T*. For all practical purposes, equil. in the combination of SO₂ with wine or must may be considered to be reached after 4 days. *T* and *R* may, therefore, be found by adding 2 different proportions of SO₂ (both greater than *T*) to a known vol. of must or wine and detg. free SO₂ after 4 days. When results are required in a short time, the free SO₂ in the 2 solns. may be detd. after 2 and again after 4 hrs., and the 2 straight-line curves plotted: if the 2 lines intersect the SO₂-axis at the same or neighboring points, this gives the value of *T*; if the 2 lines are substantially parallel *T* can be detd. only at the end of 4 days, but may be taken as approx. 1.25 times the value after 4 hrs. The values of *R* for musts and wines of a given region are fairly const., and a mean value may be taken. Values of *T* found for musts of a given region (Maine-et-Loire) were 50–170, and for wines 30–205; the values of *R* for musts were 42–56, and for wines were practically const. at 75. The amt. of SO₂ which should be added to obtain a given free SO₂ content in a given must or wine can be calcd. from its *T* and *R*.
A. PAPINEAU-COUTURE

Dry yeast fermentation. TH. SABALITSCHKA and R. WEIDLICK. *Apoth. Ztg.* 42, 1011–6(1927).—A study has been made of the fermentative action of medicinal yeast, based on the behavior of some 15 different kinds of yeast, notably with respect to the influence of concn. of sugar soln., relation of its vol. to amt. of yeast, and rapidity of fermentation as affected by NaHCO₃ in varying concn.
W. O. E.

Alcoholic fermentation of glucose solutions with water exposed to the radiations of a mercury vapor lamp. REMO DE FAZI. *Atti accad. Lincei* [6], 5, 901–5(1927); cf. *C. A.* 21, 2045.—Glucose solns. prepd. from distd. water previously exposed to ultra-violet light fermented more rapidly (when used immediately) than similar solns. prepd. from water not first irradiated. The rate of fermentation was, however, in no case so great as that of glucose solns. irradiated after their prepn. The addn. of irradiated water to pure yeast had a favorable action on the alc. fermentation. On the other hand the fermenting power of impure or enfeebled yeast was diminished by treatment with irradiated water, for when 2 identical glucose solns. were fermented with impure enfeebled yeast and to the 1st was added distd. water and to the 2nd was added an equal vol. of irradiated water, the rate of fermentation of the latter soln. diminished immediately. It is certain, therefore, that when exposed to ultra-violet light in the absence of air sterile distd. water acquires a new property which persists for a certain and still undetd. time.
C. C. DAVIS

Colorimeters based on Ostwald's theory. F. MESTAN. *Wochschr. Brau.* 43, 312–6(1926); cf. *C. A.* 21, 623.—Adler's app. for measuring color of malt exts. is more suitable than Ostwald's chrometer.
B. C. A.

The occurrence of sulfur dioxide in malt vinegar. H. E. COX. *Analyst* 52, 397–8(1927).—Many samples of malt vinegar have been examd. and none was found

absolutely free from SO_2 . From 10 to over 30 parts per million of SO_2 may be found although no preservative has been added intentionally. W. T. H.

Is the production of water-free motor fuel a luxury or a necessity? FRITZWEILER. *Z. Spiritusind.* 50, 260-70 (1927).—Abs. alc. is a necessity if its proper development as a motor fuel and its further utilization in the industries is to take place. C. N. F.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Culture of the cinchona tree in Indo-China. AUG. CHEVALIER. *Rev. botan. appl. agr. colon.* 7, 132-4 (1927).—Analyses are given of the bark from cinchona trees grown with different fertilizer treatments. The cinchonidine content varied from 0.68 to 1.18%, the highest value being obtained from trees grown in soil treated only with lime. The quinine content varied from 4.47 to 7.0%, the quinine sulfate content from 6.01 to 11.48%, and the total alkaloids from 8.2 to 10.9%. In the case of each of these the highest values were from soil treated with animal manure. M. S. A.

Commercial notices and scientific data on ethereal oils. SCHIMMEL & Co. *Ber. von Schimmel & Co.* 1926, 3-133, *Chem. Zentr.* 1926, 11, 658-9.—Among comprehensive reviews of the literature and com. notices appear the following data covering research of the labs. of Schimmel & Co. *Valerian oil* obtained from dried Thuringian valerian roots in 0.49% yield, was yellow-green, had d_{15}^{20} 0.9623, n_D^{20} 1.48599, acid no. 5.6, ester no. 128.8, was miscible with 90% EtOH in all proportions but was not wholly dissolved by 10 vols. of 80% EtOH. *Light camphor oil* is recommended as a substitute for oil of turpentine, e. g., *Type CLA*, which is very mild, has d 0.86, b 167-195°, flash point 41°; *Type CLS*, with stimulating odor, d 0.88, b 176-210°, flash point 44°; *Type FL*, with odor of conifers, d 0.89, b 180-210°, flash point 46°. *Citronella oil*.—Two samples of Ceylon oil were of inferior quality, because of their low geraniol content (26.4 and 28.2%, resp.). One was probably a by-product of the production of geraniol, and the other by its dextro-rotation showed adulteration, probably by a fraction of camphor oil. A sample from Holland, which was of high quality based on its ester no., had much too high d . (0.9559) and contained considerable BzOH , probably as BzOCH_2Ph . *Coriander oil*.—Besides adulteration with anise oil and anethole, already reported, a sample was found with terpineol. It had too high d ., too low rotation and too high acetylation no. *Elemi oil*.—A sample of elemi resin from Bandjaranegara (Java), which was distinguished from ordinary grades by its dirty-gray color changing to brownish and by its low oil content (16.7%), gave a colorless oil, d_{15}^{20} 0.8517, $[\alpha]_D^{20}$ 104°35' (after 4 mos. 68°10'), n_D^{20} 1.47779, and dissolved in 4.5 vols. of 90% EtOH with strong phellandrene reaction. *Bergamot oil*.—The consts. of 4 oils adulterated in different ways are compared with those of pure oil. The addn. of lemon oil terpenes to 2 of the oils was concluded, while the 3rd oil had been adulterated with an ester of lauric acid and a little glycerol acetate to compensate for its low ester no. resulting from the other adulterant. The 4th oil had a high terpinol acetate content. *Lemon oil*.—In one case adulteration with oil of turpentine was detected, and in another case with terpenes and a phthalic ester. Still another sample contained a large proportion of terpineol. *Eucalyptus oil*.—Oils from the *Eucalyptus dives* from Australia had a higher d . and in some cases lower rotatory power than reported by Gildemeister and Hoffmann. Oils from reliable sources had d_{15}^{20} 0.8969-0.9188, $[\alpha]_D^{20}$ -46°55' to -61°48', n_D^{20} 1.48209-1.48577 and dissolved in 0.5-1.3 vols. of 80% EtOH and were miscible in all proportions with 90% EtOH, contained 43-50% piperitone and a high phellandrene content. An oil of *Eucalyptus macarthurii* Deane et Maiden had d_{15}^{20} 0.9307, $[\alpha]_D^{20}$ 4°40', n_D^{20} 1.47534, acid no. 2.6, ester no. 166.1, ester no. after acetylation 212.8 (69.6% total geraniol) and dissolved in 3 vols. of 70% EtOH. *Galangal oil*.—Oils prepd. during the yr. had properties which in some respects did not fall within the limits already known heretofore. They had a spicy odor suggesting cardamom oil or myrtle oil, with d_{15}^{20} 0.915-0.924, $[\alpha]_D^{20}$ -1°30' to -5°30', n_D^{20} 1.476-1.482, acid no. up to 3.6, ester no. 13-17, ester no. after acetylation 40-67, soly. 0.2-0.5 part of 90% EtOH. In 2 oils there were 3% eugenol, of which 25% was found by Hoist in an oil. Over 3% eugenol indicates adulteration. *Geranium oil*.—An oil from Stellenbosch (Cape Colony), probably from *Pelargonium graveolens* Ait., was bright yellow, had d_{15}^{20} 0.8952, $[\alpha]_D^{20}$ -15°55', n_D^{20} 1.4781, acid no. 5.6, ester no. 20.5, ester no. after acetylation 207.2, ester no. after formylation 56.0. In odor it was inferior, even after rectification, to oils from other sources. *Inchi grass oil*, from *Cym-*

bopogon caesius Stapf, had d_{15}^{20} 0.9250, $[\alpha]_D -34^{\circ}25'$, n_D^{20} 1.48895, acid no. 0.9, ester no. 11.2, ester no. after acetylation 98.9, was not completely sol. in 10 vols. of 80% EtOH but was sol. in 0.3 vol. of 90% EtOH (slight opalescence). Its odor did not resemble palmarosa oil, as described by others, but rather Ceylon lemon oil. *Lavender oil* was repeatedly found to contain glyceryl acetate and phthalic ester. The detection of adulteration has recently become more difficult, on account of the addn. of several artificial esters in small quantities. Two oils were apparently adulterated with geraniol and perhaps also with geranyl acetate, though nothing could be ascertained from the constns. An alleged *marjoram* oil showed complete variation in odor and constns. from those of the true oil. Samples of the rind of *Cryptocaria pretiosa* Mart. (*Mespilodaphne pretiosa* Nees et Mart., and *Ocotea pretiosa* Benth et Hook) from Brazil gave on distn. 1.31% of a brown oil with odor resembling cinnamon, d_{15}^{20} 1.1263, $[\alpha]_D -0^{\circ}8'$, n_D^{20} 1.52787, sol in 7.2 vols. of 80% EtOH. *Oil of Nardostachys jatamansi*, obtained in 3.43% yield from roots from Japan, was olive-green with an odor resembling valerian oil, d_{15}^{20} 0.9819, $[\alpha]_D -15^{\circ}15'$, n_D^{20} 1.51790, acid no. 5.6, ester no. 18.7, not completely sol in 10 vols. of 80% EtOH, but miscible in all proportions with 90% EtOH. *Nigella oil*, from the seeds of *Nigella damascena* L. in 0.37% yield, was yellow with strong blue fluorescence, had d_{15}^{20} 0.8985, $[\alpha]_D -4^{\circ}49'$, n_D^{20} 1.49970, acid no. 1.1, ester no. 14.0, ester no. after acetylation 17.7, dissolves in about 15 vols. of 90% EtOH and about 4 vols. of 95% EtOH. *Peppermint oil*. An oil from Chile from cultivated plants had d_{15}^{20} 0.9026, $[\alpha]_D -29^{\circ}42'$, n_D^{20} 1.46638, acid no. 0, ester no. 41.1, ester no. after acetylation 189.5, dissolves to a turbid soln. in about 4 vols. of 70% EtOH and gives a clear soln. with 1.5 vols. of 80% EtOH which becomes opalescent when dild., and has an unpleasant odor, perhaps because of imperfect distn. Two samples of oil from China were similar in odor and constns. to Japanese peppermint oil. Adulteration of peppermint oil was often found, sometimes in a very crude way. A sample of "dementholized" oil bore no relation to peppermint oil, but probably came from a eucalyptus oil. *Rose oil* was in 1 case adulterated with what was probably a lauric acid ester and in another oil a myristic acid ester was identified as an adulterant. *Rose extract oils*, as shown by analysis of numerous samples from different sources, differ from the usual oils obtained by steam-distn. by their high d , n , dextro-rotation, acid no. and ester no. The dextro-rotation does not depend upon non-volatile extractive substances, as shown by distn. Rose ext. oil from fancy roses contained only about 0.5 as much geraniol as that in other grades. Adulteration of *rosemary oil* could be recognized by the odor, and particularly by acetylation. *Sandalwood oil* from western Australia, which sometimes is offered as East Indian oil, differed from the latter in odor and in its optical rotation. PhCH_2OH and terpineol were found as adulterants. *Oil of spike*. An alleged oriental product from London had other properties, and judged by its odor was a white blended camphor oil. *Oil of turpentine*. So-called Strasbourg turpentine from white fir and silver fir from Bolzano had d_{15}^{20} 1.0033, $[\alpha]_D -7^{\circ}22'$, n_D^{20} 1.52359, acid no. 83.1, ester no. 8.4. The oil obtained from it by steam-distn. (in 27.2% yield) had d_{15}^{20} 0.8650, $[\alpha]_D -7^{\circ}15'$, n_D^{20} 1.47211, acid no. 0, ester no. 11.2, dissolves in 6.2 vols. of 90% EtOH. Distn. (at 749 mm. pressure) of oil from *Ladenburg spike* gave 56% at $160-4^{\circ}$, 20% at $164-70^{\circ}$, 9% at $170-80^{\circ}$ and 15% above 180° . A *silver fir turpentine* from Upper Alsace had similar properties. A sample of *cinnamon oil* was found to be only cinnamic aldehyde.

C. C. DAVIS

New developments in the laboratory of Schimmel & Co. SCHIMMEL & Co. *Ber. von Schimmel & Co.* 1926, 133; *Chem. Zentr.* 1926, II, 659-60.—Oil of *Satureja obovata* var. *intricata* Lange (also called *Satureja montana* var. *prostrata* Boiss.) was found in popular use in Spain under the name of *saborilla*. A sample of Spanish oil was deep red-brown, had d_{15}^{20} 0.9386, $[\alpha]_D -3^{\circ}$, n_D^{20} 1.51212 and was sol. in 1.8 vols. of 80% EtOH. It contained 35% phenols, which consisted of carvacrol and thymol. The yield from dry plants was about 0.03%. *Sucupira* kernels from Brazil originated from a kind of pterodons (*P. pubescens*?). On steam-distn. they yielded 1.2% of a pale yellow oil with faint aromatic odor, d_{15}^{20} 0.9064, $[\alpha]_D -77^{\circ}50'$, n_D^{20} 1.50634, acid no. 0, ester no. 11.2, ester no. after acetylation 51.3, sol. in 3 vols. of 95% EtOH but insol. in 10 vols. of 90% EtOH. These data indicate that the oil may be rich in sesquiterpene. *Pterodon*, a legume growing extensively in Brazil, is known there as *sebipira*. C. C. DAVIS

Chemical preparations and drugs. SCHIMMEL & Co. *Ber. von Schimmel & Co.* 1926, 145-66; *Chem. Zentr.* 1926, II, 789-90.—The Schimmel method for the detn. of Cl in BzH is defended against the Faust and Spängler method (C. A. 19, 3446). "Fixoresin" is now prepd. in a large no. of different odors. A geraniol "finest" was

found to be impure, contg. about 30% of an ester of phthalic acid. *Muscone*, a prepn. of musk, in contrast to the probably closely related civetone possesses a ring without an ethylene bond and is therefore very stable toward KMnO_4 , so that it can be for the greater part recovered when steam-distd. and can thus be purified. On oxidation CO_2 and oily partially solidifying acids were obtained. CrO_3 gave an acid of the approx. compn. $\text{C}_{16}\text{H}_{30}\text{O}_4$, m. $53-8^\circ$, b_p 237° , optically inactive; *Ba salt*, *Ag salt* $\text{Ag}_3\text{C}_{17}\text{H}_{32}\text{O}_4$. *Muscone* is perhaps $\text{MeCH}(\text{CH}_2)_7\text{CO}(\text{CH}_2)_6$. With Na and $\text{C}_6\text{H}_{11}\text{OH}$ it is easily re-

duced to the alc. *muscol* $\text{C}_{16}\text{H}_{32}\text{O}$, m. 38° , b_2 in 2 fractions, $153-6^\circ$ and $156-77^\circ$, which is oxidized by boiling CrO_3 or KMnO_4 back to muscone; *IICo₂H ester*, b_p 173.5° ; *phenylurethan*, $\text{C}_{23}\text{H}_{35}\text{O}_2\text{N}$, m. $97-8^\circ$. *Muscone oxime*, converted by warming with fairly concd. H_2SO_4 (4 parts) to *muscone isooxime*, m. $90-95^\circ$. In crude oil of musk, valeric acid was probably identified. The chloral hydrate test for fatty oils in *Peru balsam* requires exact adherence to prescribed proportions and absolutely dry chloral hydrate. The balsam is not miscible in all proportions with vaseline, probably because of the presence of resinotannol esters, and so distinct resinous deposits may be found. A sample of cinnamaldehyde of the correct d., but optically active and unsatisfactory soly., contained 49% aldehyde, the remainder apparently being oil of turpentine or a fraction of the latter.

C. C. DAVIS

Researches on the ethereal oil of Geranium macrorrhizum L. of Bulgaria. PAOLO ROVRSI. *Notiz. chim.-ind.* 2, 438-9(1927).—An oil which has recently become popular in the manuf. of perfumery in Bulgaria is distd. from a plant considered there to be *Pelargonium bulgarica*. Examn. of the plant from this source proved that it is *Geranium macrorrhizum* L., which grows over a wide area in Europe. The oil was semi-fluid, and was composed of a solid cryst. mass in a liquid part. It was yellowish green, and had a characteristic odor. After drying with Na_2SO_4 , the oil m. 28° , had d_{16}^{50} 0.9411, $[\alpha]_D^{30}$ $-3.55'$, n_D^{38} 1.5093, acid no. 0.78, sapon. no. 3.53, sapon. no. after acetylation 28.6, soly. 1 part in 1.2 parts of 90% EtOH at 18° . The solid component of a paraffin nature was insol. in dil EtOH and was purified with this agent. After washing with dil. EtOH, and recrystg. from EtOH it formed lustrous, odorless rhombic crystals, m. $49-50^\circ$, decompd. above 290° to a viscous mass which did not resolidify even when chilled. Deprived of the stearoptene, the oil represented 53% by wt. of the original 2-phase mixt. This liquid portion was greenish yellow, and possessed all the odor of the original oil, d_{23} 0.93622, $[\alpha]_D$ $-7.5'$, n_D^{20} 1.4975, acid no. 1.38, sapon. no. 5.91, sapon. no. after acetylation 61.60, soly. 1 part in 2.1 vols. of 80% EtOH at 20° . It underwent no diminution of vol. with 5% aq. NaOH, gave an immediate violet-red color with Schiff reagent, and shaken 5 hrs. with 30% NaHSO_3 , 18-19% of carbonyl compds. were absorbed. Fractionated under ordinary pressure, it began to distil at 188° and at $220-5^\circ$ partially decompd. This ethereal oil which was sepd. from the paraffin component is being studied further. When the com. oil is added to oil of rose, the characteristics of the latter are changed so little and are so agreeable that it is not a harmful adulteration. The only reference elsewhere to the oil is a recent one (*Ber. Schimmel & Co.*, Aug., 1927, 114-5).

Esters of butyric acid as perfumes. A. M. BURGER. *Ruechstoffindustrie* 1926, 131-2; *Chem. Zentr.* 1926, II, 2124.—A description of the chem. and odoriferous properties of a no. of esters of butyric acid, with special reference to phenylpropyl butyrate, cinnamyl butyrate and *p*-cresyl butyrate.

C. C. DAVIS

Oil from immature bitter oranges. PEPPILO LIOTTA. *Rivista ital. essenze profumi* 7, 141(1925); *Chem. Zentr.* 1926, II, 1209.—The oil, which was obtained in low yield from the leaves and twigs of *Citrus bigarade* Risso, was sol. in 2 parts of EtOH, contained 61% esters and gave $[\alpha]_D^{20}$ -6° .

C. C. DAVIS

Influence of the absolute reaction of the soil on the formation and the composition of the essential oil of Marjolaine. HENRY DEEL AND (MMH.) HENRY DEEL. *Bull. soc. chim.* 41, 955-7(1927).—The optimum p_H is in the neighborhood of 9.5. The yield of plant and essence diminishes with decreasing p_H . Variations in p_H are without great influence on the % of essential oil in relation to the plant wt., except in the highly acid range. The optimum p_H is that which yields a max. proportion of total and of free alc. in the essence.

P. R. DAWSON

Sulfur iodide. WALTER ERHARD. *Apoth. Ztg.* 42, 925-6(1927).—A discussion of

this compd. as formerly used in homeopathic preps. of high attenuation, and more recently recommended in allopathic medication. In order to minimize the loss of I in such preps. this element is now introduced in the form of iodized starch. It is thus possible to prep. a S iodide of the 3rd potency having an I content of about 0.8%.

W. O. E.

Estimation of potassium iodide in tincture of iodine. R. WEINLAND. *Apoth. Ztg.* 42, 1228(1927); cf. Warnecke, *C. A.* 21, 3704.—A weighed portion of the sample is evapd. to dryness on the steam bath and the evapn. repeated several times after addn. of a little H_2O until the residue is colorless. It is then weighed.

W. O. E.

Fermentative action of medicinal yeast and certain yeast preparations. TH. SABALITSCHKA AND R. WEIDLICH. *Apoth. Ztg.* 42, 1224-5(1927).—An exptl. study of pharmacopoeial and other preps. of yeast relative to their activity.

W. O. E.

Manufacture of chloral hydrate. ANON. *Pharm. Presse* 32, 381-4(1927).—A detailed description of app. employed, the proportions of chemicals used in the several stages of mfg. $CCl_3CH(OH)_2$.

W. O. E.

Manufacture of salol. ANON. *Pharm. Presse* 32, 293(1927).—A technical procedure is outlined for the manuf. of salol by condensation of salicylic acid and phenol in the presence of $POCl_3$, including a description of the app. needed, the proportions of the several chemicals, and the precise steps involved in producing the pure drug.

W. O. E.

Alkaloids of Aconitum stoerckianum Reichenbach. HEINRICH SCHULZE AND GOTTFRIED BERGER. *Arch. Pharm.* 265, 524-41(1927).—This species possesses a total alkaloidal content of 0.48%. The alkaloids occurring therein appear to be in every respect identical with those already isolated from *Aconitum napellus* L.

W. O. E.

Estimation of atropine in pills. O. IHRISMANN. *Arch. Pharm.* 265, 547-9(1927).—A record of the results obtained in the examn. of aq. exts. of atropine pills when applied to the eyes of cats.

W. O. E.

Fatty oil of ergot. HERMANN MATTHES AND PAUL SCHÜTZ. *Arch. Pharm.* 265, 511-6(1926).—The fatty acids of ergot oil consist of about 28% solid and 72% liquid components, the latter in turn consisting of about 50% hydroxyoleic, 45% oleic and 5% linoleic acids. The hydroxy acid is being subjected to further study.

W. O. E.

Detection of chlorophyll by means of the quartz lamp. P. W. DANCKWORTT AND E. PFAU. *Arch. Pharm.* 265, 560-2(1927); cf. *C. A.* 21, 1328.—Crude drugs in powdered form contg. chlorophyll yield under the analytical quartz lamp a reddish fluorescence when treated with Et_2O . Thus, the color of *Herba lobelia* is red; *Cortex Chinae*, none; *Herba absinthii*, violet-red; *Fructus capsici*, olive; *Radix ipecacuanhae*, blue; *Folia digitalis*, red; *Flores arnicae*, none. Pharm. tinctures show varying fluorescence, as such, and after treatment with Et_2O and H_2O . As small an amt. of digitalis tincture as 0.05 cc. gave a distinct red fluorescence, which persists even after the addn. of 5% ipecacuanha tincture. The fluorescence may perhaps serve in the sepn. of chlorophyll into its 2 components. Thus, on dissolving crude chlorophyll in MeOH and repeated extn. of this soln. with petr. ether, the fluorescence of the MeOH soln. becomes less and less while that of the petr. ether exts. becomes progressively intense.

W. O. E.

Artificial musk, its preparation, application, adulteration and control. ALFRED WAGNER. *Chem.-Ztg.* 51, 646-7(1927); cf. *C. A.* 21, 3705.—The present paper deals specifically with ketone musk, the application of artificial musk infusions and tinctures in perfumery, the adulteration and testing of musk preps.

W. O. E.

Estimation of nicotine in tobacco. L. FRANK. *Chem.-Ztg.* 51, 658(1927).—Into a shaking cylinder (separatory app. of the Röhrig type) of 250-cc. capacity and having a discharge cock between the 60 and 70 cc. marks introduce 10 g. of the finely powd. sample, 10 cc. of 20% KOH soln., and a mixt. of 100 cc. Et_2O and 100 cc. petroleum ether, then shake the closed cylinder $\frac{1}{4}$ hr. vigorously, this treatment being often repeated, whereupon the mixt. is set aside for some hrs. or allowed to stand overnight. Withdraw through the side cock 100 cc. (= 5 g. of the sample) of the completely cleared soln., passing it through a filter charged with fused Na_2SO_4 into an Erlenmeyer flask, the filter being finally washed with some Et_2O -petr. ether mixt., the solvents thereupon distd. and the residual greenish mass extd. with cold H_2O . Filter after standing some time, and titrate with 0.1 N HCl with Congo red as indicator. A sample of Brazilian tobacco (cigar) and another of smoking ("Ehrenstein") tobacco yielded the following values, resp. *via*, Kissling 1.69, 1.69, 1.68; 0.87, 0.85, 0.86%; *via*, Keller 1.65, 1.65, 1.64; 0.83, 0.81, 0.82%; *via*, Toth modified 1.62, 1.64, 1.62; 0.82, 0.83, 0.83%; *via*, Frank 1.65, 1.65, 1.64; 0.83, 0.82, 0.84%. Kissling's procedure requires the longest time, because of the steam distn. prescribed. Keller's method involving extn. with Et_2O - $EtOH$ is convenient and gives good results, provided no loss of nicotine results from evapn. of

the solvents or from dissipation of NH_3 by a stream of air. Furthermore, the titration with iodoosin is not always exact. Finally, losses may occur in Rundhagen's modification of Toth's method during the H_2O filtration. W. O. E.

Detection and estimation of thymol. F. W. KLINGSTEDT AND F. SUNDBSTRÖM. *J. prakt. Chem.* 116, 307-13(1927).—The fact that the Me and Et ethers of thymol lend themselves under suitable conditions to nitrosation affords a means for the detection of thymol in the presence of carvacrol, which under like treatment fails to yield a nitroso deriv. The same reaction may also be used to det. thymol quantitatively. Thus, if 2 g. of thymyl methyl ether is dissolved in 30 cc. of EtOH and 4 cc. of AcOH the soln. is thereupon satd. with HCl followed by addn. of 1 g. NaNO_2 in 2 g. of H_2O , a ppt. of nitrosothymol will be formed, which can then be washed and weighed. A mixt. of carvacrol and thymol yields after methylation and nitrosation as above nitrosothymol in the same proportion as this substance is present. W. O. E.

Cyprus otto of rose. W. H. SIMMONS. *Perfumery Essent. Oil Record* 18, 346 (1927).—The consts. obtained in the examn. of a sample of oil recently distd. at the Kykko Monastery, Cyprus, are compared with values yielded by an oil prepd. in 1922 under the direction of the Greek Minister of Agriculture, likewise with those giving the usual range for Bulgarian otto. The comparative values are, resp.: d_{20} 0.875, 0.8724, 0.850-0.860; α $-2^\circ 0'$, $-2^\circ 0'$, $-1.5-4^\circ$; n_{25} 1.4697, 1.466, 1.458-1.465; congealing pt. 16.5, 16.0, 18-23°; m. 18.0, —, 19-24.5°; sapon. no. 18.0, 16.5, 7-18; ester no. as linalyl acetate 6.3, 5.7, 2.5-6.3; citronellol 32.6, —, 30-40%; stearoptene 7.3, —, 14-20%; m. p. of stearoptene 32.5, —, 32-34°. While this sample of Cyprus otto has a relatively high d. and n as might be expected with so small an amt. of stearoptene as 7.3%, there is a greater proportion of elcoptene, the odorous constituents of the oil and hence a greater odor value. This is confirmed by its particularly powerful odor, which is at the same time very sweet and fragrant. W. O. E.

Sandalwood oil and the B. P. K. B. MAVLANKAR. *Perfumery Essent. Oil Record* 18, 347(1927).—It is shown by documentary evidence that the only sandalwood oil which is recognized by the Brit. Pharm. is the oil distd. from *Santalum album*, Linn., alone, and that the Australian product is not a B. P. oil. W. O. E.

Fluid extracts from domestic drug plants. LUDWIG KROEBER. *Pharm. Zentralh.* 68, 23-5, 36-8, 163-5, 374-6, 452-5, 518-20, 609-11(1927); cf. *C. A.* 19, 871; 20, 3060.—A continuation of similar studies on *Ext. Pulmonariae officinalis* (d_{19} 1.02, dry residue 15.30%, ash 3.70%); *Ext. foliorum Potentillae anserinae* (d_{19} 1.077, dry residue 27.60%, ash 3.90%); *Ext. Linariae vulgaris* (d_{19} 1.066, dry residue 24.53%, ash 2.95%); *Ext. Fumariae officinalis* (d_{19} 1.106, dry residue 28.35, ash 4.30%); *Ext. Agrimoniae eupatoriæ* (d_{19} 1.055, dry residue 18.78%, ash 1.65%); *Ext. foliorum Juglandis* (d_{19} 1.029, dry residue 15.45%, ash 2.15%); *Ext. Urticae dioica* (d_{19} 1.024, dry residue 12.45%, ash 2.25%). The extrn. liquid was a mixt. of 3 pts. of EtOH and 7 pts. of H_2O . A bibliography accompanies each article. W. O. E.

Manufacture of bismuth salts. F. CHEMNITIUS. *Pharm. Zentralh.* 68, 513-8 (1927).—The prepn. of the more important salts of Bi used in pharmacy and medicine is outlined in considerable detail. W. O. E.

Calcium-salicylic acid therapy. ERICH HERRMANN. *Pharm. Zentralh.* 68, 497-9 (1927).—An account of various attempts to develop a compd. involving the therapeutic properties of Ca and salicylic acid and possessing reasonable stability. Attention is directed especially to a recent new drug, agit, which is essentially a mixt. of the Ca salts of salicylic and lactic acids. W. O. E.

Plant alkaloids in chemistry and pharmacy. K. H. BAUER. *Pharm. Zentralh.* 68, 529-36(1927).—A discussion. W. O. E.

Drug synthesis and specialties. H. P. KAUFMANN. *Apoth. Ztg.* 42, 944-7(1927).—A discussion. W. O. E.

Color reactions of certain phenols with aldehydes. LAD. EKKERT. *Pharm. Zentralh.* 68, 563(1927).—The color reactions resulting from the admixt. of CH_2O , $(\text{C}_2\text{H}_4\text{O})_2$, $\text{C}_6\text{H}_5\text{CHO}$, furfural, sucrose, BzH , PhCH_2CHO , anisaldehyde, salicylaldehyde and cinnamaldehyde, vanillin, piperonal and citral, resp., with resorcinol, hydroquinone, orcinol, pyrogallol, phloroglucinol, α - and β -naphthols, PhOH , thymol, carvacrol, pyrocatechol, guaiacol, guaiacol carbonate, eugenol and creosol are summarized in considerable detail. The tests are carried out by mixing 4 drops of a 1% phenolic soln. in 96% alc. with 4 drops of a 1% soln. of the aldehyde in 96% alc. and adding thereto 0.5 cc. of concd. H_2SO_4 . W. O. E.

Color reactions of essential oils and certain of their constituents. LAD. EKKERT. *Pharm. Zentralh.* 68, 577-83, 593-602(1927).—The manner of application and reagents

were similar to or identical with those used in the preceding study. The color changes obtained with a large no. of oils are presented in tabulated form. W. O. E.

Chenopodium oil. H. THOMS. *Pharm. Ztg.* 72, 1123-4 (1927).—A discussion of American wormseed oil from the standpoints of exhibition and pharmacopoeial recognition. W. O. E.

Isolation of nicotine from *Nicotiana attenuata*. Torr. J. F. Couch. *Am. J. Pharm.* 99, 519-23 (1927).—Detn. according to the method of Young (*C. A.* 21, 1077) showed the presence of total alkaloid calcd. as nicotine in the dried plant as follows: leaves 1.45, stems 0.48, and roots 0.25%. According to results obtained by Chapin's method (*C. A.* 6, 529) there is apparently no nonvolatile alkaloid present. Nicotine was isolated and found identical chemically and pharmacologically with nicotine from *N. tabacum*. The lethal dose of nicotine injected intraperitoneally in guinea pigs was detd. as 17 to 20 mg./kg. W. G. GAESSLER

Studies in the genus *Mentha*. XIII. An examination of an oil of *Mentha piperita* L. produced in 1924. S. M. GORDON. *Am. J. Pharm.* 99, 524-30 (1927); cf. *C. A.* 18, 1178; 20, 92, 1301, 3212.—The present investigation of the oil from a known strain of *Mentha piperita* L. grown at Madison, Wis. has revealed the following: Only 13% of the free menthol can be "frozen out" in spite of the fact that the oil contains about 50% free and combined menthol. The presence of the previously described compds. was confirmed, viz. *l*-menthone, *d*-pulegone, *l*- α -pinene. The presence of *d*-menthone and a terpinene not previously reported was established. The 1924 oil contains neither phellandrene nor limonene as previously reported. W. G. GAESSLER

An improved apparatus for testing the activity of drugs on the isolated uterus. II. P. S. PITTENGER. *Am. J. Pharm.* 99, 531-8 (1927); cf. *C. A.* 8, 3097; 12, 2585; 17, 3569.—P. has designed a new app. which, although essentially the same in general principle as the various forms of app. described in previous publications, has many improvements which lead to greater accuracy and simplicity of operation. A brief description of this app. and the assay method are supplemented with photographs and graphic drawings. W. G. GAESSLER

Properties and constituents of an oil extracted from the seeds of *Digitalis purpurea*. I. S. MELLANOFF. *Am. J. Pharm.* 99, 549 (1927); cf. *C. A.* 21, 3706.—An amber-colored oily liquid having a peculiar fatty odor and a bland taste; n_D^{20} 1.4755, sp. gr. 0.9231 at 15.5°, acidity-figure 9.3, sapon. no. 207.5, ester figure 198.2, unsaponifiable matter 6.12%, sol. fatty acids 1.66%, insol. fatty acids 90.0%, hydroxy fatty acids none, volatile fatty acids 4.8 cc. 0.1 N Ba(OH)₂, liquid fatty acids 75.8%, n_D^{20} of liquid fatty acids 1.4670, solid fatty acids 9.2%, n_D^{20} of solid fatty acids 1.4685, glycerol 11.4%, I no. (Hanus) 127.9. W. G. GAESSLER

New technical progress in disinfectants. W. H. GESELL. *Am. J. Pharm.* 99, 555 61 (1927).—A review and discussion. W. G. GAESSLER

The loss of morphine in powdered opium by keeping; its causes and prevention. A. C. ABRAHAM AND J. RAE. *Am. J. Pharm.* 99, 570-84 (1927). See *C. A.* 21, 154. W. G. GAESSLER

The new medicinal products of the year 1926. J. HERZOG. *Deut. med. Wochschr.* 53, 967-9 (1927).—A review of the following compds.: synthalin, plasmochin, vigantol, dilaudid, betilon, bulbocapnine and ephedrine. ARTHUR GROLLMAN

Report of the essential oil sub-committee on uniformity of analytical methods. JOHN ALLEN, et al. *Analyst* 52, 530 (1927); cf. *C. A.* 21, 2758.—Recommendations with respect to sp. gr., refractive indices, optical rotation and statement of temps. W. T. H.

The development of pharmaceutical synthesis. WERNER SCHULEMANN. *Naturwissenschaften* 15, 633-6 (1927).—A review. B. J. C. VAN DER HOEVEN

Results of investigation of remedies, patent medicines, cosmetics and similar products. C. GRIEBEL AND F. WEISS. *Z. Untersuch. Lebensm.* 53, 545-8 (1927); cf. *C. A.* 20, 2722.—A report of ingredients found in various preps. W. J. H.

Conditions for the extraction of the active glucosides of *Adonis vernalis*. G. A. PEVZNER. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 3, 78-84 (1923).—Extn. in a Soxhlet with abs. alc. and percolation with MeOH and EtOH give good standardized products and all of the active principle is extd. Prolonged extn. with water (20 times) also takes out all of the active principle. The alc. does not influence negatively the glucosides; on the contrary it increases its activity (formation of anhydrous forms). Heating to 100° weakens somewhat the action of the glucoside. J. S. JOFFE

The scope of the scientific chemico-pharmaceutical institute for the study of essential oils and perfumes. B. N. RUTOVSKII. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 4, 3-9. J. S. JOFFE

The problem of the constants of Russian mint oil. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm.* 1923, No. 4, 10-13.—Some of the mint oil produced in Russia showed the following consts: $[\alpha]_D = -20^\circ$ to -27° , d_4^{15} 0.914-0.915. The quantity of menthol in the form of ethers is 6-15%, free menthol 41-51%, menthone 16-18%, acid number 0.7-1.0. Methods of extrn. are described. J. S. JOFFE

Constituents of Russian fennel oil. B. N. RUTOVSKII AND P. P. LEONOV. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 4, 16-24.—Russian fennel oil contains about 55% anethole, *d*-fenchone, *d*- α -pinene, dipentene, α -phellandrene, camphene and anisaldehyde. The methods of sepg. the various fractions are described. J. S. JOFFE

Constituents of essential oil of *Artemisia maritima* not containing santonin. B. N. RUTOVSKII AND S. A. BUSSE. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 4, 25-33.—It contains 27.8% cineole and 7-8% β -thujone. The presence of camphene has been demonstrated; α -pinene, β -pinene, phellandrene and terpene are absent. The presence of limonene and dipentene is doubtful. The methods of obtaining the fractions are given. J. S. JOFFE

Bibliographical essay of odoriferant plants and oils. B. N. RUTOVSKII. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 4, 34-52.—A bibliography of approx. 500 titles, in Russian. J. S. JOFFE

Crimean plants containing essential oils. B. N. RUTOVSKII. *Trans. Sci. Chem.-Pharm. Inst.* 1923, No. 8, 5-32.—R. gives a list of plants contg. ethereal oils which can be raised in Crimea, Russia. Illustrations of the plants are given, as well as the nature of the oils which can be extrd. J. S. JOFFE

Spinal anesthesia with anhydrous cocaine. Observations on 557 additional cases. J. R. WELLS. *Ann. Surgery* 85, 757-64(1927).—Cocaine crystals (1 g.) were dissolved in 25 cc. abs. alc. after 3 to 4 hrs. 150-200 cc. dry ether was added; a crystalline ppt. was formed. The supernatant liquid, when siphoned and evapd. gave a light brown residue which formed in flakes, was hygroscopic, sol. in water or spinal fluid and non-toxic. This anhydrous cocaine gave good results when used as an anesthetic. F. K.

The chemistry of "Sanguis Draconis" from *Dracaena draco*. SIGMUND FRANKEL AND ERICH DAVID. *Biochem. Z.* 187, 146-58(1927).—"Sanguis Draconis" is a red dye from the resin obtained from fruit of *Dracaena draco*. It has a compn. corresponding to the formula $C_{17}H_{18}O_4$, and is an unsatd. compd. whose ozonide on hydrolysis yields a dicarboxylic acid, $C_{12}H_{22}O_8$. On oxidation with dil. HNO_3 there are formed a keto acid, *dracaenic acid*, $C_{11}H_{11}O_5 \cdot CO_2H$, m. 120° (hydrazone m. 204°), and *dracotic acid*, $C_8H_9O_5 \cdot CO_2H$, sublimes 130° , crystallizes from water with $4H_2O$, m. 178° (Et ester, $C_7H_{10}O_6$, m. 154° , Ba salt), forms no hydrazone nor oxime. S. MORGULIS

The bitter principle of *makabuhay*, *Tinospora rumphii* Boerlage. JOAQUIN MARANON. *Philippine J. Sci.* 33, 357-61(1927).—This plant is indigenous in the Philippines and is considered a valuable remedial agent. The bitter principle was extrd. by boiling the freshly sliced stems with water for 30 min., decanting the liquid and repeating the process several times. The combined aq. exts. were evapd. and the residue was extrd. with boiling 95% alc. After many treatments and purifications a white powder was obtained, sol. in alc., slowly sol. in water and insol. in Et_2O or $CHCl_3$, m. $154-155^\circ$. It appears to be a glucoside of the compn. C 41.15, H 11.67, O 47.18. L. W. RIGGS

The system bromural-pyramidone. HÅKAN SANDQVIST AND WALDEMAR HÖK. *Svensk Farm. Tids.* 51, 377-81, 393-6(1927).—Two series of mixts. of bromural and pyramidone were submitted to Rheinboldt's method (C. A. 20, 693). When plotted the two were in very good agreement and showed that these two substances remain as a mixt. and do not combine. The eutectic point comes at 42.8% bromural and 80.8°. The "thaw" curve passes 5.5° below the eutectic point and approximates the horizontal line only between 25 and 79% bromural. A. R. ROSE

A forgotten Turkish pharmacopeia. J. ZANNI. *Chemist & Druggist* 106, 470 (1927).—The work referred to is the Ottoman Military Pharmacopeia, compiled by C. A. Bernard, Constantinople-Pera, 1844, in Latin and French. S. WALDBOTT

The purity of ether. F. A. HOCKING. *The London Hospital Gazette, Chemist & Druggist* 106, 592(1927).—Ether of the highest grade of purity is now considered to give the best results in anesthesia. To test for peroxides in Et_2O , add to 5 cc. Et_2O 1 cc. 0.1 N KCNS and 1 drop of freshly prepd. 5% soln. of $FeSO_4 \cdot (NH_4)_2SO_4$. A pink color is produced at once if peroxides are present. The test is sensitive to 1:1,000,000. S. WALDBOTT

Hygienic mouth washes. J. AUGUSTIN. *D. Parf. Ztg.* No. 5, 1927; *Schweiz. Apoth. Ztg.* 65, 243-5(1927).—Discussion and formulas. S. WALDBOTT

Glycerol-kaolin paste in gynecological therapeutics. H. GALMIER. *J. pharm. d'Alsace Lorraine* 54, 15-7(1927).—The formula glycerol 20 kg., kaolin 30 kg., I 3.5

g., H_3BO_3 45 g., salicylic acid 9 g., essence of peppermint, eucalyptus, gaultheria, 6 g. of each is suggested; the indications and mode of application are described. S. W.

Analogy between two sirups having ferrous salts as a base. SCHISSELÉ. *J. pharm. d'Alsace Lorraine* 54, 99-100(1927).—Sirup of FeI_2 turns brown in the dark, not because of formation of free I, as it does not turn blue with starch; FeI_2 is partly oxidized in the dark, but exposure to direct sunlight restores the green color. Similarly, sirup of Ca and Fe lactophosphate in the dark forms a flaky ppt. of $\text{FePO}_4 + \text{Fe}_2\text{O}_3$, but becomes limpid again in sunlight, the ferrous salt being restored. S. WALDBOTT

Applied pharmacognosy: Congo cubebs. L. ROSENTHALER. *Pharm. Acta Helv.* 2, 29-30(1927).—Congo cubebs, a substitute for genuine cubebs in the Hamburg market, are identical in their morphological and anatomical characteristics and in their chem. behavior towards H_2SO_4 with the fruits of *Piper guineense* Schumann. S. W.

Determination of the theobromine content of theobromino-sodium salicylicum. JULIUS VON MIKÓ. *Pharm. Acta Helv.* 2, 51-2(1927).—Dissolve 1 g. of the salt in 5 cc. H_2O in a porcelain dish, add 20 cc. of 96% EtOH and 5 drops of 5 N HCl. Allow to stand for 10 min., stirring repeatedly. Bring the ppt. upon a filter moistened with alc., rinse the dish with 2×10 cc. 96% EtOH, and dry the ppt. to const. wt. The yield should be at least 0.40 g., and the ppt. should readily give the murexide test. In the place of EtOH, a mixt. of equal vols. of Et_2O and 96% EtOH may be used. S. WALDBOTT

A rare admixture noted in succus liquiritiae depuratus. AXEL JERMSTAD. *Pharm. Acta Helv.* 2, 52-3(1927).—Crystal sand insol. in H_2O , observed in a certain lot of purified licorice juice, proved to be $\text{Mg}(\text{NH}_4)\text{PO}_4 \cdot 6\text{H}_2\text{O}$. The component parts of this substance are naturally contained in licorice root. S. WALDBOTT

Stomatal numbers, their value for distinguishing species. HELEN A. TIMMERMAN. *Pharm. J.* 118, 241-3(1927).—An attempt to base differentiation of several species of *Datura* on the actual no. of stomata per sq. mm. of the upper or lower epidermis of a leaf, was largely unsuccessful; only with *D. innoxia* an apparent regularity was noted. S. WALDBOTT

The Scarborough herb garden. Report for 1926. H. M. HIRST. *Pharm. J.* 118, 298-300(1927).—A report on the cultivation of 46 medicinal plants for sale to students in pharmacy. S. WALDBOTT

A note on iron and ammonium citrate, Brit. Pharm. F. J. TODD. *Pharm. J.* 118, 731, 790; *Chemist & Druggist* 107, 22-3(1927).—This compd. (A) in aq. soln. may remain clear on standing or may ppt., depending on whether the soln. is neutral or distinctly acid. The non-pptg. soln. contained 6.39-6.97% NH_3 , the pptg. soln. 5.51% NH_3 . The next Brit. Pharm. should require the aq. soln. of A to be neutral, or very faintly acid or alk. to litmus, and the quantity of NH_3 present should be not less than 6.9% NH_3 . The frequent addn. of MgSO_4 to A in prescriptions causes in aq. soln. the reversed conditions of pptn. or non-pptn.; those distinctly acid remain clear, those neutral ppt. on standing. S. WALDBOTT

The official preparations of cinchona barks. F. J. TODD. *Pharm. J.* 118, 731-4; *Chemist & Druggist*, 107, 23-4(1927); cf. Bennett, *C. A.* 18, 149.—Cinchona bark should be assayed for its total alkaloidal content only, omitting the (official) sep. detn. of quinine and cinchonine. The Brit. Pharm. assay method gives low results. A new assay method proposed is based on the fact that an alc.- NH_3 menstruum completely removes the total alkaloids by percolation or hot extn. Treat 5 g. of the bark in No. 60 powder by hot extn. with a mixt. of 97.5 vol. of 90% alc. and 2.5 vol. of strong NH_3 soln. Evap. the liquid, to which 2 cc. glycerol is added, to about 10 cc., transfer to a separator, washing the basin with a mixt. of 5 cc. (or less) each of H_2O and alc.; then add 10 cc. N KOH, ext. the alkaloids repeatedly with Et_2O contg. 5 cc. alc., wash the united Et_2O solns. with 20 cc. dil. NH_4OH , then ext. with dil. HCl, add NH_3 , and transfer the alkaloids into CHCl_3 , wash with a little H_2O and evap. to const. wt. The Brit. Pharm. cinchona preps. are criticized for incomplete extn. of alkaloids and lack of uniformity in appearance and behavior when dispensed. It is suggested to introduce a soft ext. of cinchona standardized as to its total alkaloidal content and prepd. according to a process based on the above method of assay of the bark. From this soft ext., the fluid ext., tinctures and infusions may be prepd. according to formulas given. Tables are included showing the results of analyses of com. samples of liquid ext. of cinchona, the assay of cinchona bark by different methods, and comparison of results in prepg. samples of the liquid ext. and tincture of cinchona by the official and proposed methods, indicating the % of total available alkaloid extd. in each case. Thus, e. g., liquid ext. and tincture gave, resp., 55.1 and 60.7% yield; by the proposed soft ext. method, 92.1%

yield. Further extn. of the 3 (dried) marcs yielded, resp., 43.9, 35.7, 7.05%.

S. WALDBOTT

Sulfur sublimatum. C. OLIVE GRIFFITHS. *Pharm. J.* 118, 734-5, 791; *Chemist & Druggist* 107, 24-5(1927).—Several samples of genuine sublimed S have been examd., and a simple method for detg. the % sol. in CS_2 is given. The globules characteristic of sublimed S consist of a sol. portion (70.92-81.68%) assocd. with an insol. part. An admixt. of ground S to sublimed S may be detected by the presence of colorless, sharply angular (not yellow, subangular) particles which are abundant in ground S. Finally, modifications in the Brit. Pharm. monograph on S are suggested. S. WALDBOTT

Stramonium and other species of Datura: A comparative study of the structure of their leaves. HELEN A. TIMMERMAN. *Pharm. J.* 118, 735-91; *Chemist & Druggist* 107, 25-6(1927).—A detailed botanical description, with macroscopical and microscopical sketches of the leaves of *Datura stramonium* Lin., *D. tatula*, Lin., *D. innoxia*, Miller, *D. metel*, Lin. and *D. fastuosa* Lin. A key for the identification of the powd. leaves of these species is given, also a list of 15 references. S. WALDBOTT

Stramonium and other species of Datura: A comparative study of the structure of their seeds. HELEN A. TIMMERMAN. *Pharm. J.* 118, 742-6, 791-2; *Chemist & Druggist*, 107, 26-7(1927).—Botanical description with sketches of microscopical sections of the seeds of 5 species of *Datura* (see preceding abstr.). A key for distinguishing the powd. seeds of these species is given, also a list of 10 references. S. WALDBOTT

Tragacanth and its mucilage. II. NORMAN EVERS AND THOMAS McILACHLAN. *Pharm. J.* 118, 746-7, 792; *Chemist & Druggist*, 107, 27-8(1927); cf. C. A. 18, 3103; 21, 3710.—Considerable deterioration takes place in tragacanth on keeping, as judged by the strength of the mucilage prepd. from it. The process is hastened by drying (e. g., over H_2SO_4), and is prevented by keeping in a moist atm. Mucilages made in the cold after keeping for a year, have a better suspending power than those made by heating. S. WALDBOTT

Note on the identification and determination of morphine in compound tincture of camphor. C. M. CAINES. *Pharm. J.* 118, 751-2, 792; *Chemist & Druggist* 107, 28 (1927).—The KIO_3 color reaction with morphine (A) allows quite accurate and rapid detn. of very small quantities of A in official liquors contg. A, as well as the detn. of A in ampoule preps., pills and tablets. With official solns. no preliminary treatment is necessary. Adjust the given soln. to approx. 0.002 g. A in 10 cc., add 10 drops of $\text{N H}_2\text{SO}_4$, 10 drops of a satd. soln. of KIO_3 , allow to stand for 5 min., add 10 drops of strong NH_3 soln., and at the end of 2 min. compare the color produced with that obtained from a standard soln. of A treated similarly. In the case of compd. tincture of camphor, Brit. Pharm. (B), contg. in the form of tincture of opium 0.05 g. A in 100 cc., add to 20 cc. B 1 to 2 drops of dil. AcOH , evap. to dryness on a water bath, dissolve in 10 cc. 60% EtOH , evap., dissolve the residue in 10 cc. H_2O , add slight excess of $\text{Pb}(\text{AcO})_2$, bring to 20 cc.; to an aliquot add Na_2HPO_4 , filter, render an aliquot of the filtrate alk. with KOH , and ext. any non-A alkaloids present, with 3×10 cc. Et_2O . These may be examd. after evapn. of the Et_2O . Wash the alk. liquid with CHCl_3 , then mix with NH_4OH and ext. A by the method of Nicholls (C. A. 17, 850), i. e., with an alc. CHCl_3 mixt. (1:1 then 3 or $4 \times 0.5:1$); evap., dry at 100° , weigh, then add 10 drops of $\text{N H}_2\text{SO}_4$ and finish the detn. of A as before. The KIO_3 test is sp. for A except in presence of *psychotrine* (Yodd, in discussion, *Ibid* 792); however, this alkaloid will be removed in the preliminary treatment with Et_2O . S. WALDBOTT

Carbolic acid suppositories, Brit. Pharm. 1914. HARRY BRINDLE AND L. H. BOARDMAN. *Pharm. J.* 118, 760-1, 793; *Chemist & Druggist* 107, 34(1927).—The official process is unsatisfactory, as the presence of white wax requires excessive heating of the mixt. of oil of theobroma and PhOH to melt the wax; this excess of heat greatly delays the solidification of the suppositories. Conversely, it was proved that wax used in the Brit. Pharm. quantity was of no advantage in retarding the softening upon slowly raising the temp., as samples prepd. without wax remained firm at temps. at which those made with wax had softened. A satisfactory procedure is as follows: Take PhOH , 0.8 g.; oil of theobroma, a sufficient quantity for 12 suppositories. Melt the oil of theobroma and powder the PhOH ; allow the oil to cool, with continuous stirring until it shows signs of solidification by becoming less transparent (at about $25-26^\circ$); add the powd. PhOH , stir until dissolved, and pour the melted mixt. into suitable molds. S. WALDBOTT

A new method of locating the end-point in alkaloidal titrations. C. MORTON. *Pharm. J.* 118, 761-3, 794; *Chemist & Druggist*, 107, 39(1927).—The paper describes a simple device by means of which the end-point of alkaloidal titrations and of other reactions may be detd. electrometrically without the use of a potentiometer. The de-

flections of a galvanometer used in conjunction with a thermionic valve give directly the $\Delta E/\Delta V$ values required for constructing the differential titration curve of Hostetter and Roberts (*C. A.* 13, 2319). Unlike the arrangement of Goode (*C. A.* 16, 665), which is intended only for rough measurements, the equivalence point is located with a degree of accuracy equal to that of the potentiometric method. The method differs from the differential titration methods of Cox (*C. A.* 19, 2610) and of MacInnes and Jones (*C. A.* 21, 367) in the rapidity with which the titration is carried out, and in the improved sensitivity due to the amplifying properties of the valve. S. W.

The extractive of ginger. J. R. WALMSLEY. *Pharm. J.* 118, 763-4, 792; *Chemist & Druggist* 107, 29-30(1927).—Results of the detns. of alc. and aq. exts. and ash, of African, Cochin and Jamaica gingers are tabulated. They show that the Brit. Pharm. requirement of a min. of 5% for alc. ext. excludes 10 out of 15 samples of the best grades of Jamaica ginger while admitting all of the African, and 70% of the Cochin samples. It ignores the equally valuable aromatic, oily part which predominates in the oleoresin of Jamaica ginger, and which is volatilized on evap. the alc. soln. Scraped, unleached Jamaica ginger should exclusively be used in pharmaceutical preps. In the Brit. Pharm. the figure for alc. ext. should then be reduced to 3.5-4%, or omitted altogether, as in U. S. P. S. WALDBOTT

A supplementary paper on official astringent drugs. A. H. WARE. *Pharm. J.* 118, 764 7, 793-4; *Chemist & Druggist* 107, 34 5(1927); cf. *C. A.* 20, 93; 21, 155.—Descriptions and analytical results are given of 3 com. red gums from authentic botan. sources; *i. e.*, kinos from *Eucalyptus rostrata*, *E. calophylla* and *Angophora lanceolata*. H₂O, resp., 12.85, 10.42, 8.81%; soly. in alc. 80.77, 81.44, 84.81%; soly. in hot H₂O 87.05, 85.38, 79.59%; residue insol. in H₂O 0.1, 4.2, 11.6%; ash 0.56, 0.67, 0.48%. More exact details are also given of processes of extn. of, and tests for certain tannin-bearing materials previously dealt with. S. WALDBOTT

The detection of carboic acid in commercial cresols. A. H. WARE. *Pharm. J.* 118, 775-6, 794; *Chemist & Druggist*, 107, 35-6(1927).—The Brit. Pharm. test for the detection of PhOH in cresol is useless, as it fails to indicate added PhOH. A new method of testing is described, involving (1) the sepn. of partially purified PhOH from cresol by shaking out with a limited quantity of alkali: To 10 cc. of the "cresol" mixt. add 10 cc. 0.1 N KOH, shake, centrifuge and remove the upper phenate layer, from which shake out free PhOH with Et₂O; reject this soln. Acidulate the phenate layer and shake out the PhOH with Et₂O, evap. the soln. (2) Apply to the residual PhOH the crimson or purple color test with NaNO₂ (*C. A.* 21, 2635). In the absence of PhOH, only a non-distinctive, reddish color is formed, turning brown with NH₄OH. S. W.

Spiritus aetheris and spiritus chloroformi; the variation of the specific gravity with the proportions of the ingredients. F. H. MILNER. *Pharm. J.* 118, 776-7, 794; *Chemist & Druggist* 107, 36-7(1927).—The sp. grs. of mixts. of CHCl₃ and 90% alc., and of Et₂O and 90% alc. have been detd. With CHCl₃, a slight expansion takes place; with the Et₂O mixts., considerable contraction is noted. The object of the expts. was to ascertain whether a simple detn. of sp. gr. was a sufficient indication of the concn. of these spirits. The results illustrated by graphs show that the sp. gr. is a reliable index of the compn. of the mixt. S. WALDBOTT

Biological methods in modern pharmacy. B. E. READ. *Pharm. J.* 119, 3-5 (1927).—An address on biol. standardization of drugs. S. WALDBOTT

The ambiguities of pharmacopeial nomenclature. A. J. SOMER. *Pharm. J.* 119, 7 9(1927).—A plea for conciseness and uniformity of statement in the directions and tests for identity and purity of drugs and preps. in the forthcoming Brit. Pharm. Cf. F. C. J. Bird, *Ibid* 118, 589(1927). S. WALDBOTT

Liquid extract of belladonna. F. J. TODD. *Pharm. J.* 119, 31(1927).—An exptl. crit. examn. of Franklin's new process of prepn. (cf. *C. A.* 21, 1522, 3424). The theoretical yield of alkaloids claimed for F.'s method, could not be obtained; at most only 77.2% was recovered. Certain more definite directions of procedure should be given. S. WALDBOTT

The melting point of barbitone. G. J. W. FERREY. *Pharm. J.* 119, 31-2(1927).—The m. p. of barbitone, given by Brit. Pharm. at 191°, by U. S. P. X "between 187 and 190°", after recrystn. from different solvents varied from 189.2 to 189.7° (alc., abs. and dil.), 189.6° to 190° (redistd. C₆H₆), 189.5° to 190.0° (hot H₂O). Limits of 189.0° to 190° for com. and purified barbitone are suggested. S. WALDBOTT

Chinese medicine. ADAM CLARK. *Pharm. J.* 119, 137-9(1927).—A detailed review of ancient Chinese medicine, materia medica and practical pharmacy. S. W.

The constituents of crude drugs. III. Essential oils. J. E. DRIVER and G. E. TREASE. *Pharm. J.* 119, 164-7(1927); cf. *C. A.* 21, 3253.—A review of essential oils,

with graphic formulas of their characteristic terpenes, alcohols, aldehydes, ketones, phenols and phenolic ethers. A summarizing table classifies the essential oils of the Brit. Pharm. according to their principal constituents. S. WALDBOTT

Lucky Tiger. ANON. *J. Am. Med. Assoc.* 89, 541(1927).—Analysis showed d_{20} 0.9414, Na salicylate 0.47, NaAsO_2 0.15, EtOH 37.74, MeOH 8.7%. Recommended for treatment of dandruff and falling hair. L. E. WARREN

Harrell Associated Chemists Rheumatism Treatment. ANON. *J. Am. Med. Assoc.* 89, 637(1927).—The treatment consists of 6 gelatin globules, 4 tablets and 4 pink capsules. The globules contained Me salicylate, the tablets cinchophen, while the capsules contained NaHCO_3 colored pink. L. E. WARREN

Weldona for Rheumatism. ANON. *J. Am. Med. Assoc.* 89, 1167(1927).—Various analyses of this prepn. have appeared. The "treatment" formerly consisted of lavender-coated tablets and white tablets. The white tablets have been reported to contain ext. of cascara. The lavender-colored tablets have been reported variously to contain Na salicylate, unidentified vegetable extractive, salicylic acid, acetylsalicylic acid, emodin-bearing drug extractives, cinnamon and ginger. A recent analysis indicated salicylic acid, acetylsalicylic acid, phytolacca and cascara. Alkaloids were absent. Neocinchophen was not identified. L. E. WARREN

A. R. C. Epilepsy Remedy. ANON. *J. Am. Med. Assoc.* 89, 1167-8(1927).—The remedy consists of 30 capsules. Each capsule contains about $1\frac{1}{2}$ grains of phenobarbital, a considerable amt. of an emodin-bearing drug and a dye. L. E. WARREN

The potency of various samples of digitalis grown in British Columbia. M. I. SPARKS. *J. Am. Pharm. Assoc.* 16, 203-9(1927).—Plants grown in Brit. Columbia only a yr. or two from the wild state were studied. Some of the plants had been fertilized with NaNO_3 , others not. *Digitalis purpurea* with purple bloom, *D. purpurea* with white blooms and *D. lutea* leaves were assayed by the U. S. P. X 1-hr. frog method and by the Magnus-Wyngaarden method (C. A. 20, 2706, 3511). For comparison a standard sample grown in England standardized for com. use and a standard sample supplied by the Int. Conf. for Bio. Prod., as prepd. by Magnus, were used. Tinctures and infusions were tested. The results by the 2 methods were not strictly comparable. This confirms the observations of other workers. By the cat method the white- and purple-flowered varieties gave about the same values, the white being possibly a little stronger; by the frog method the white-flowered variety was definitely weaker. A mixed sample of the Canadian drug was almost as potent as the standard English-grown leaf. *D. lutea* is stronger than *D. purpurea* by both methods, the difference being more striking by the cat method. The drug which had been fertilized was about 40% more potent than the unfertilized leaf and the yield of leaf per acre was increased about 15%. L. E. WARREN

A phytopharmacological study of digitalis assay. D. I. MACHT and J. C. KRANTZ, JR. *J. Am. Pharm. Assoc.* 16, 210-8(1927). See C. A. 21, 2960. L. E. WARREN

The U. S. P. X nitrate test as applied to solution of ferric chloride. M. W. CAREY and R. F. SCHOETZOW. *J. Am. Pharm. Assoc.* 16, 229(1927).—In soln. of FeCl_3 U. S. P. X nitrate is tested for by the ring test. In KI, nitrate is tested for by the $\text{Al} + \text{NaOH}$ test. A specimen of FeCl_3 soln. gave a positive ring test but a negative result by the $\text{Al} + \text{NaOH}$ test. Two solns. of FeCl_3 were prepd. without HNO_3 , the oxidation being induced by (1) H_2O_2 and heat and (2) gases from $\text{KClO}_3 + \text{HCl}$. Both solns. gave a positive ring test but a negative result with $\text{Al} + \text{NaOH}$. The ring test is, therefore, fallacious. L. E. WARREN

The occurrence and alkaloidal content of various Ephedra species. C. NIELSEN, H. McCausland and H. C. SPRUTH. *J. Am. Pharm. Assoc.* 16, 288-94(1927).—The species of *Ephedra* reported in the continental U. S., are *E. nevadensis*, *E. californica*, *E. viridis*, *E. trifurca*, *E. torreyana*, *E. antisiphilitica* and *E. pedunculata*. Specimens of a number of these were obtained. Some were identified and some were not. The roots, stems and green branches, when possible, were assayed separately for alkaloid, by the U. S. P. IX method for belladonna root. No alkaloids were found. In *Ma huang* the alkaloids are found in the green branches only. L. E. WARREN

Ephedrine, its isolation and detection from the toxicological standpoint. KUEN TSIANG and E. D. BROWN. *J. Am. Pharm. Assoc.* 16, 294-6(1927).—Cryst. ppts. are given slowly with Millon's reagent, AuCl_3 , PtCl_4 and Kraut's reagent. No color reaction is given with FeCl_3 . The alkaloid was mixed with ground meat and the Stas-Otto method applied. The alkaloid was recovered in pure form but quant. relations are not stated. L. E. WARREN

The standardization and stabilization of aconite preparations. III. E. E. SWANSON and C. C. HARGREAVES. *J. Am. Pharm. Assoc.* 16, 296-301(1927); cf. C. A. 18,

882; 19, 2862.—The p_H value controls the detn. and stabilization of aconite preps. It is recommended that tinctures and fluidexts. of aconite have a p_H value of between 2.5 and 3.00. The guinea-pig method and the white-mouse method agree remarkably well on standard aconite preps. but they do not agree when the deterioration factor is detd.

L. E. WARREN

The glucosides of *Caulophyllum thalictroides*. J. D. DAVY AND H. P. CHU. *J. Am. Pharm. Assoc.* 16, 302-5(1927).—Analysis of *Caulophyllum* by the method of Power and Salway (*C. A.* 7, 1706) yielded Me cystine and a non-cryst. glucoside which differed from that described by P. and S. A modification of the method gave a similar non-cryst., glucosidal product. By moistening the drug to allow enzyme action a cryst. and a non-cryst. glucoside were obtained. The glucoside in some respects resembles the caulosaponin of P. and S. but it is optically active. The caulophyllosaponin of P. and S. was not identified. The pharmacologic properties of the glucosides are being studied.

L. E. WARREN

The melting point of acetylsalicylic acid. T. S. CARSWELL. *J. Am. Pharm. Assoc.* 16, 306-9(1927).—The m. p. of finely powd. acetylsalicylic acid is 135° with variations of not over 0.2° . The m. p. of acetylsalicylic acid is dependent upon the size of the particles in the m.-p. tube, and to obtain uniform results grinding to a standard fineness must be adopted. The nearest approach to the true m. p. is given by the method of the new German Pharm., after grinding to 200 mesh. Variations in the m. p. after crystn. from different solvents are caused by differences in the phys. structure of the crystals, since grinding to a fine powder gives uniform m. p.

L. E. WARREN

Some interesting facts about mercurochrome. FITZGERALD DUNNING. *J. Am. Pharm. Assoc.* 16, 329-31(1927).—A short essay for the information of pharmacists.

L. E. WARREN

A pharmaceutical study of sirup of ferrous iodide (1840-1927). C. J. BRAFORD AND H. A. LANGENHAN. *J. Am. Pharm. Assoc.* 16, 336-9, 433-7, 561-7, 656-60(1927).—Historical review.

L. E. WARREN

A study of *Ephedra nevadensis*. R. E. TERRY. *J. Am. Pharm. Assoc.* 16, 397-407 (1927).—Three types of *Ephedra* are known, viz. the Asiatic, the European and the American group. The last includes 6 species, *Ephedra californica*, *E. nevadensis*, *E. trifurca*, *E. viridis*, *E. torreyana* and *E. antisiphilitica*. *E. nevadensis* is used in domestic medicine in Mexico. Plants were gathered in south central California. *E. californica*: H_2O 6.4-6.7%; ash 5.0-6.8%; acid-insol. ash 0.36-0.40%; ground drug: crude fiber 20.4-20.5%. *E. nevadensis*: macroscopical and microscopical characteristics are described. Unground drug: H_2O 5.1-5.6%; ash 6.8-7.4%; acid-insol. ash 0.25-0.31%. Ground drug: H_2O 8.0-8.3%; ash 6.4-14.6%; acid-insol. ash 0.3-0.7%. Whole drug: crude fiber 42.2-42.6%. Ground drug: 14.7%. Total Et_2O -sol. 6.3-8.1%; volatile H_2O ext. 0.6%; non-volatile Et_2O ext. 7.5%; resin 0.4%; $EtOH$ -sol. 17.6%; H_2O -sol. 8.3%. Alkaloids were absent. Tannin (gallotannic acid) was found in large amts. but quant. tests gave poor results. Traces of volatile oil were found. Infusions of the drug are slightly diuretic. The total absence of ephedrine is the most important fact discovered.

L. E. WARREN

Examination of *Asarum caudatum*. H. M. BURLAGE AND E. V. LYNN. *J. Am. Pharm. Assoc.* 16, 407-11(1927).—The rhizomes and roots contain from 2 to 4% of volatile oil, the yield depending on the time of collection. The contents of the oil of different seasons are tabulated. The oil contains azulene 10%, α -arone 10%, methyl-eugenol 60-75%, traces of pinene and probably other terpenes.

L. E. WARREN

A study of the stability of physostigmine solutions. J. C. KRANTZ, JR. AND F. J. SLAMA. *J. Am. Pharm. Assoc.* 16, 412-4(1927).—Solns. of physostigmine salts become red on long standing. The color is due to the formation of eseroline. The salicylate is more stable than the sulfate. The salt is stable in a satd. soln. of salicylic acid (p_H 2.45) or in H_2SO_4 of p_H 3.7; CO_2 in the soln. or in the atm. above the soln. does not stabilize for long, but a combination of the 2 stabilizes for long periods. N is not so effective.

L. E. WARREN

A modified Calvert test for diethyl phthalate. R. D. SCOTT AND E. G. WILL. *J. Am. Pharm. Assoc.* 16, 417-9(1927).—In the original Calvert test (*C. A.* 17, 1202) 5-10 drops of $PhOH$ is added to 3-5 cc. of sample, 10 drops of H_2SO_4 is added and the mixt. heated with a Bunsen burner. S. and W. find that the heat of a boiling water bath is sufficient for the reaction if allowed to proceed overnight. The amt. of H_2SO_4 may be materially reduced, thus allowing a reduction of the alkali required. The sensitivity of the test is increased by increasing the amt. of $PhOH$. For convenience the $PhOH$, H_2SO_4 and $EtOH$ may be added together. The sensitivity is increased by

carefully adjusting the amt. of alkali added at the end, the optimum pH being between 11 and 12. L. E. WARREN

Some applications of colloidal chemistry to pharmacy. PELL BROADY AND C. B. JORDAN. *J. Am. Pharm. Assoc.* 16, 425-30(1927).—Many expts. were conducted in the effort to apply the principles of colloidal chemistry to practical pharmacy. A formula for prepg. *Hg ointment* was developed. Dissolve 2.5 g. of gelatin and 40 g. of NaOH in 200 cc. of H_2O with heat. Cool and add 20 g. of 37% HCHO. Dissolve 40 g. of $HgCl_2$ in 200 cc. of H_2O with heat. Add the hot soln. slowly to the alk. gelatin mixt. with stirring. Wash the ppt. twice by decantation with 200 cc. of H_2O . Filter, transfer the moist ppt. to a mortar, add 25 g. of anhyd. lanolin and mix. Add white petrolatum to 100 g. The advantages claimed over the usual ointment are: (1) the ointment is more readily prepd. and (2) in less time and (3) the Hg is in finer suspension. *Prepn. of Ag ointment*.—Dissolve 4 g. of dextrin and 4 g. of NaOH in 100 cc. of H_2O ; dissolve 3 g. of $AgNO_3$ in 20 cc. of H_2O and pour the latter soln. into the former with stirring. The ppt. of Ag_2O gradually changes to Ag. This is pptd. by EtOH and the ppt. washed with EtOH. The moist ppt. is mixed with anhyd. lanolin. A stable, colloidal AgCl was prepd. by treating a soln. of $AgNO_3$ in gelatin with dichloramine-T. The AgCl was collected on a filter. The suspension of AgCl was stable for several days in sunlight. Colloidal AgCl was prepd. by adding a soln. of $HgNO_3$ to a soln. of NaCl and gelatin. The suspension was stable. L. E. WARREN

Physiological potency of imported ergot of rye. GEORGIANA S. GITTINGER AND J. C. MUNCH. *J. Am. Pharm. Assoc.* 16, 504-5(1927).—Samples from 69 shipments from various foreign countries were assayed by the official cockscomb method. Of these 42 or 60% were stronger than the U. S. P. standard. Five contained mites but they were as active (or were more potent) as the standard. Three of 5 Polish samples were substandard. Seven of 9 Russian samples were below U. S. P. requirements. Of 27 Spanish samples 26 were of full strength. Of 22 consignments from miscellaneous ports 16 were below standard. L. E. WARREN

The assay of ergot by the cockscomb method. GEORGIANA S. GITTINGER AND J. C. MUNCH. *J. Am. Pharm. Assoc.* 16, 505-10(1927).—Ergot preps. should be converted into fluidexs. for assay. Single-comb White Leghorn cocks have been found the most satisfactory breed of bird for assay purposes. Variations in sensitivity to ergot are found in birds used for assay. Therefore, all birds should be standardized before being used for the assay of unknown samples. Durations of the effect of injection of the drug should be noted. Expts. under way suggest the possibility that the prescribed rest period may be safely reduced to one week. A sufficient no. of assays should be made on any unknown sample definitely to det. its potency. L. E. WARREN

The colorimetric assay of digitalis. L. W. ROWE. *J. Am. Pharm. Assoc.* 16, 510-6(1927).—The Knudson and Dresbach picric-acid colorimetric method for the assay of digitalis (*C. A.* 16, 3711) was compared with the M. L. D. frog-heart method of Houghton. In 6 tinctures the colorimetric method gave results 40-50% too high. The artificial color standard (0.344 g. $K_2Cr_2O_7$ per l.) suggested by Knudson was tried thoroughly and discarded because the artificial color was not the same as that developed in the purified digitalis solns. In a second series of 23 various preps. of digitalis the colorimetric values were from 77 to 42% high as compared with the frog method. In a third series the technic was standardized by always making the comparative readings of the standard and sample 20 min. after the color of the final mixt. had started to develop. In 19 samples the colorimetric method gave results 16% low to 50% high. Digitalin is not a satisfactory standard. In a fourth series of preps. the color tests averaged 32% high. With ouabain as a standard the extremes were too far apart. German digitalin and digitoxin were used as standards but were abandoned because the colors produced by different lots did not correspond to the activity by the frog method. The color test for digitalis is not satisfactory as a means of detg. therapeutic value. L. E. WARREN

The possible influence of ether anesthesia on the accuracy of the cat method of digitalis assay. H. B. HAAG. *J. Am. Pharm. Assoc.* 16, 516-8(1927).—The light ether anesthesia necessitated in the Hatcher-Brody cat method of digitalis assay does not materially influence the resulting minimal lethal dose. L. E. WARREN

The theory and art of pharmacopeia revision, in the interest of pharmaceutical service. H. H. RUSBY. *J. Am. Pharm. Assoc.* 16, 528-34(1927).—Ten fundamental principles on which pharmacopeia revision is based are outlined. Examples are cited which indicate that most of the enumerated principles are violated in the revision which resulted in the U. S. P. X. L. E. WARREN

Incompatibilities of prescriptions containing epinephrine hydrochloride. M. J.

ANDREWS. *J. Am. Pharm. Assoc.* 16, 555-6(1927).—Four prescriptions calling for epinephrine-HCl are given and their incompatibilities discussed. Two were rendered alk. by the presence of borax; 1 contained AgNO_3 and another mineral oil. L. E. W.

Flavoring qualities of vanilla tinctures. H. M. TAYLOR AND R. A. KONNERTH. *J. Am. Pharm. Assoc.* 16, 556-61(1927).—Mexican beans give the best flavor, Bourbon being second and Tahiti third. Tahiti beans should never be used except in the cheapest exts. The circulatory displacement method gives the best results. At least 3 months should be allowed for the extn. Aging is necessary and the process should continue for at least a yr. A single type of vanilla tincture will not flavor all preps. with a max. strength and fragrance of flavor. For preps. to which heat is to be applied, such as puddings, cakes, candy, etc., a tincture made from pure Bourbon bean is best; for preps. not subjected to heat a mixt. of 40% Mexican beans and 60% Bourbon beans gives a tincture having the most desirable properties. A comprehensive bibliography is appended. L. E. WARREN

The earthworm method for testing santonin and related anthelmintics. ALBERT SCHNEIDER. *J. Am. Pharm. Assoc.* 16, 623-7(1927).—An outline of a proposed method. No exptl. results are recorded. L. E. WARREN

Some colloidal chemical aspects of pharmacognosy. ANTON HOGSTAD. *J. Am. Pharm. Assoc.* 16, 627-32(1927).—An address. L. E. WARREN

New methods for the determination of cinchophen and the choice of indicators for its titration. S. PALKIN. *J. Am. Pharm. Assoc.* 16, 632-5(1927).—Previously described methods have depended on the extn. of cinchophen from the other ingredients by a solvent and titration of the acidity of the ext. P. observes that cinchophen may be completely extd. from an acidified soln. by means of Et_2O or CHCl_3 . (A mixt. of equal vols. of the 2 solvents is recommended.) About 8 shake-outs are necessary. The solvent is washed twice with H_2O , the soln. evapd. and the residue weighed. In a second method the alk. soln. of cinchophen is acidified with an excess of dil. H_2SO_4 , a soln. of KBrO_3 .KBr added and the resulting Br compd. removed by shaking with successive portions of Et_2O . The solvent is washed and evapd. to remove excess Br with precaution to avoid decrepitation. Before dryness is attained acetone is added and the evapn. continued. Several treatments with acetone usually give a residue of const. wt. Electrometric titration indicates that phenol red, bromothymol blue and cresol red are suitable indicators for titration of cinchophen in H_2O soln. L. E. W.

Interpretation of biologic assays. PAUL S. PITTENGER. *J. Am. Pharm. Assoc.* 16, 714-7(1927).—An essay. L. E. WARREN

Determination of total citric acid in solution of magnesium citrate. J. L. MAYER. *J. Am. Pharm. Assoc.* 16, 719-22(1927).—The U. S. P. X. method is unsatisfactory. A method is suggested which gives results more rapidly and which are as accurate. Into a Pt or porcelain evapg. dish measure 10 cc. of a soln. of Mg citrate, freed from CO by pouring from one container to another, add 10 cc. H_2O , evap. until the vol. is 10 cc., titrate the acidity with 0.5 N NaOH using phenolphthalein. Evap. the neutralized liquid to dryness and ignite; cool, moisten with H_2O and evap.; ignite, repeating the process until a white ash is obtained. Add 30 cc. of 0.5 N H_2SO_4 and heat on a steam bath for 5 min.; cool and titrate with 0.5 N NaOH using methyl orange. L. E. WARREN

The need of greater activity in the making of analyses of medicinal preparations found in the open market and of a wider publicity of the analyses. F. J. WULLING. *J. Am. Pharm. Assoc.* 16, 722-4(1927).—Comment on a report by Prof. G. Bachman of the Minn. Pharm. Assoc., on drug adulteration. L. E. WARREN

The quality of drug products. R. L. SWAIN. *J. Am. Pharm. Assoc.* 16, 724-6(1927).—A study of 1300 drug products collected in Md. over a period of 2 yrs. Of the total no. 153 or 12% were below standard. S. considers this to be a good showing for pharmacy. L. E. WARREN

Theoretical structure of the correction factor as applied in the menthol assay of peppermint oil—with a note on the assay of oil of rosemary. SIMON MENDELSON. *J. Am. Pharm. Assoc.* 16, 726-29(1927).—M. believes that the correction factor prescribed for the oils of peppermint and rosemary by the U. S. P. X. might be obviated by using the method of assay recommended by Parry (Com. Org. Analysis, Allen, ed. 5, vol. 4, 596). M. quotes the method but gives no analytical results. L. E. WARREN

The work, principal purposes and ideals of the American Pharmaceutical Association. J. H. BEAL. *J. Am. Pharm. Assoc.* 16, 799-809(1927).—An address. The details of the achievements of the Am. Pharm. Assoc. during the nearly 76 yrs. of its existence are recorded in 59 vols. of Proceedings, 13 vols. of the Year Book, 6 vols.

of the Bulletin and 16 vols. of the Journal, making 94 vols. in all, comprising a total of more than 76,000 printed pages, without including the 5 separately published revisions of the National Formulary. L. E. WARREN

Monardella oil. E. R. MILLER. *J. Am. Pharm. Assoc.* **16**, 828(1927).—A species of *Monardella*, probably *M. lanceolata*, grows abundantly in the Yosemite and Lake Tahoe regions of California. The odor of the plant suggested pulegone. The yield of oil from air-dried plant was 1% d_{16}^{20} 0.9392; n_D^{20} 1.4908; $[\alpha]_D^{20}$ +17.4°. Pulegone was identified and appeared to be the chief constituent of the oil. L. E. WARREN

Reaction of anesthetic ethers with potassium hydroxide and with mercury and the test for foreign odors. EDWARD MALLINCKRODT, JR. *J. Am. Chem. Soc.* **49**, 2655-66(1927).—Under av. conditions, if Et_2O contains less than about 0.05% of aldehyde it will probably not be detected by the official aldehyde test in U. S. P. X., whereas the test employing solid KOH will, with the precautions given in this paper, detect 0.01%. Peroxides and alc., if present, produce characteristic appearances in this test; their effects are described. Shaking with metallic Hg provides a convenient means of decomp. the org. peroxides naturally occurring in old Et_2O with liberation of ACH in accordance with the work of Clover and Winkler on the constitution of these peroxides. The presence of more than minute traces of peroxides in Et_2O can be detected by a characteristic odor when the Et_2O is evapd. to small vol. and smelled after pouring upon paper. C. J. WEST

Dry yeast fermentation (SABALITSCHKA, WEIDLICH) **16**. Some observations on digitalis action (SCHNEIDER) **11H**. Standardization of digitalis (MARTIN) **11H**.

Arsenical medicinal composition. I. OSTROMUISLENSKII. U. S. 1,644,348, Oct. 4. Arsphenamine or other arsenical compns. of relatively high toxicity are used with gum arabic, which reduces their toxicity, to permit intravenous injection, and with glucose, which renders the compd. isotonic with respect to the blood.

Ergot preparation. GUSTAV ERDMANN. U. S. 1,645,096, Oct. 11. The oily residue from an ether ext. of ergot after evapn. of the solvent is treated with naphtha or similar reagent and the ppt. is sepd., washed and dried, dissolved with 10% HOAc, purified by shaking with ether repeatedly, alkaloids are pptd. from the soln. with NH_3 and tartrate salts are formed from the sepd. and dried ppt. Some other modifications of the procedure are also described as optional.

Anesthetic. O. BILLETER, E. ROTHLIN and J. PEYER. Can. 274,214. Sept. 27, 1927. Anesthetics are prepd. by causing suitable salts of $m\text{-H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ esters to react by double decompn. with suitable salts of alkylsulfonic acids.

Gaseous mixture containing helium (for respiration). W. P. YANT, R. R. SAYERS and J. H. HILDEBRAND. U. S. 1,644,363, Oct. 4. Persons under compression are supplied a mixt. for respiration consisting mainly of O and N (with a lower % of O than in air), and while under decompression, with a gas comprising mainly O and He.

Salts of quinine combined with acetylaminohydroxyphenylarsonic acid. F. BILLON. U. S. 1,643,692, Sept. 27. Alkaloids such as quinine are combined with acetylaminohydroxyphenylarsonic acid directly or by reaction of salts of the components. The products are therapeutic agents of but slight toxicity.

Heterocyclic compound. A. BINZ and C. RATH. Can. 274,750. Oct. 18, 1927. Heterocyclic compds., contg. N_2 as a hetero-constituent and being free from active carbonyl groups, are diazotized and the products caused to react with substances of the general formula $\text{R}(\text{OR})_3$, in which R represents a therapeutically valuable element like As and Sb and R_1 represents an electropositive element which may be H_2 .

Decreasing the toxicity of cocaine. R. ECKERMANN. Swed. 61,992, Nov. 23, 1926. A salt or a deriv. of cocaine is treated with an org. acid or base, or an alc., or a phenol or a mixt. of these, with or without heat, and there is added urethan or a salt or deriv. of urethan which has also been treated with an org. acid or base, an alc., a phenol or a mixt. of these. Together with several by-products a cocaine prepn. is then obtained which has a reduced toxicity and an increased local-anesthetic power.

Concentrating deposits of radioactive emanations or similar active material. H. B. PALMER. U. S. 1,644,350, Oct. 4. A plurality of carrying bodies such as pills are introduced into a vessel which is also supplied with emanations from radioactive material and these bodies are subjected to a negative elec. potential, shielded against active deposit and then successively unshielded for subjection to the emanation to adapt them for internal medication. An app. is described.

Bile acid derivative. A. GAMS and P. SCHNEIDGGER. Can. 274,267. Sept. 27,

1927. Compd. of therapeutic substances are manufd. by causing an asymmetrically acylated aliphatic diamine to react with a bile acid in presence of a solvent.

Dentifrice. W. BRUCK. U. S. 1,643,618, Sept. 27. Soap and mild abrasive materials such as talc. are used with alkali salts of phenolsulfonic acids such as Na *p*-phenolsulfonate and other ingredients, *e. g.*, glycerol, tincture of benzoin and alc.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

FRED C. ZEISBERG

Concentration of sulfuric and nitric acids, Strzoda system. W. STRZODA. *Chem.-Ztg.* 51, 525-6 (1927).—To concentrate the H_2SO_4 it is passed through 8 externally heated "Acidur" tubes in series; the vapors are sepd. into 60° Bé. acid and steam in a filled tower, the acid running back into the concn. system, the steam condensing in a cooling tower. The capacity is around 0.8 ton of 97 to 98% H_2SO_4 per tube. A HNO_3 concn. system is similarly constructed, strong H_2SO_4 being added to the dil. HNO_3 for dehydration; the H_2SO_4 is regenerated in a second system coupled to the first by an acid-scaled connection.

B. J. C. VAN DER HOEVEN

The volumetric relations in the conversion of hydrogen sulfide to sulfurous acid. R. NITZSCHMANN AND E. VOGEL. *Chem.-Ztg.* 51, 557-8 (1927).—Formulas and graphs are given for the calcn. of the usual quantities involved in the oxidation of H_2S .

J. H. P.

Ammonia as a source of nitrogen oxides for chamber acid plants. D. H. KILLER. *Ind. Eng. Chem.* 19, 1153-6 (1927).—The substitution of NH_3 -oxidation units for the common niter pots in Pb -chamber H_2SO_4 plants effects decided savings in the cost of raw materials, labor and upkeep. One 75-ton plant using the new system has obtained a reduction of more than 2% in the cost of the finished acid. A complete description of the NH_3 -oxidation process is given for the use of both anhydrous NH_3 and NH_4OH .

J. H. PERRY

A new method for the evaporation of electrolytic caustic. W. L. BADGER. *Trans. Am. Inst. Chem. Eng.* 18, 231-48 (1927).—An evaporator of the vertical tube type was designed with forced circulation by an external pump. The velocities were 5-10 ft. per sec. at the bottom of the tubes. The result was a very high coeff. of heat transfer, and the heating surface for a commercial machine became so small that it could be made of Ni tubes. No trouble was experienced from salting. The coeffs. were so high that small working temp. drops could be used, and this made possible concn. from cell liquor to 40% $NaOH$ in triple effect with steam at 25 lbs. gage. A diagram giving the boiling points of $NaOH$ solns. at diff. pressures is given, but it is in error at high concns. In the discussion, *caustic embrittlement of steel* is covered at length.

W. L. BADGER

The influence of methane on the synthesis of ammonia. R. SCHÖNFELDER. *Ber. Ges. Kohlen-techn.* (Dortmund-Eving) 1925, 514-39; *Chem. Zentr.* 1926, II, 2470.—The point is calcd. at which the slightest increase in the CH_4 content or decrease in the H through NH_3 formation causes deposition of C. At 700° and 1 atm. total pressure a CH_4 content of 6.7% is admissible and at 700° and 100 atm. pressure, 70%. Under ordinary operating conditions there is accordingly no danger of CH_4 decompn. The diluent effect of CH_4 is more objectionable as shown by tabulated data obtained with the aid of the Tour curves (cf. *C. A.* 15, 1967). With 50% CH_4 the yield of NH_3 drops almost to 0.25 of that obtained with pure N and H . $Ca_3Fe(CN)_6$ dehydrated and decompd. in a current of air at 800° served as catalyst (cf. *German Patents* 285,698 and 286,719). The app. is described. At ordinary pressures thoroughly dried and purified gases give the best yield at 475° and a "space velocity" of 2000. CO_2 and H_2O behave as poisons, no NH_3 being formed in their presence at the temp. most favorable for its formation with N and H when pure or contg. CH_4 . Toward 600-690° the poisonous action disappears, though the equil. is still unfavorable. If because of increased temp. with 36% CH_4 there is deposition of C, this does not exert any poisonous action. With subsequent replacement of the mixt. contg. CH_4 by a new gas mixt., a far more favorable yield is obtained. The "space velocity," which at first had been reduced to about 0.5 its value because of obstruction of the pores, increases after partial removal of the C as CH_4 to 80% of its original value. The yield from pure gases, which is 62% at 500°, increases to 88%. At a working pressure of 100 atm. and a "space velocity" of 8600, the optimum temp. was found to be 590°. The dependence of the quantity of NH_3 on the CH_4 content is shown graphically. When with CH_4 -free gas the "space-time yield," is 0.132; the latter decreases to 0.048 when 51% CH_4 is present. In an expt. of 102 hrs., CH_4 had

no slow poisonous action. After 30 hrs. the "efficiency," i. e., the NH_4 content obtained expressed as % of that present in the equil., increased, confirming the results of Firmin (C. A. 16, 2200; *Industrie Chimique* 9, 339, 436). With increasing "space velocity," the NH_4 content and the "efficiency" diminish, while the space-time yield increases. Surprising and also of importance for the use of coke-oven gas is a decrease of the "efficiency" with increase in the N content. At 100 atm. pressure, 590° , 30% CH_4 and a N/H ratio of $1/38$ it is 80, while with N/H 1/14 it is only 52. Detailed tabular data show, however, that even 8 contact ovens joined in series have less than 0.5 the capacity required for a mixt. of 30.2% CH_4 , 52.5% H and 17.3% N at 300 atm. pressure, 600° and a "space velocity" of 8000. Claude, however, with CH_4 -free chilled gas at 900 atm. pressure and a "space velocity" 10 times as great attains 20 times as great a yield, so that the relatively troublesome cooling is justified.

C. C. DAVIS

Production of synthetic ammonia at the works of the Badische Anilin and Soda Fabrik at Oppau. H. W. STRONG. *Ind. Chemist* 3, 403-5(1927).—A short account, illustrated, is given of the manuf. of NH_3 and $(\text{NH}_4)_2\text{SO}_4$ from producer gas.

E. G. R. ARDAGH

Rapid catalytic processes in flowing gases and ammonia oxidation. V. LEONID ANDRUSSOV. *Ber.* 60B, 2005-18(1927); cf. C. A. 21, 1872.—Formulas are derived mathematically for calcg. the NH_3 concn. gradient along a heated Pt capillary tube when a mixt. of NH_3 and O is passed through the tube. It is postulated that oxidation to NO takes place only at the catalyst surface, and that reaction to yield N takes place only in the free gas space. The effect of gas flow and initial gas compn. on the reaction in heated Pt capillaries was measured. The results are compared with those calcd. by the above formulas.

R. L. DODGE

The production of ammonium sulfate and sulfur from ammonium thiosulfate. W. GLUUD AND R. SCHÖNFELDER. *Ber. Ges. Kohlentechn.* (Dortmund-Eyving) 2, 23-5; *Chem. Zentr.* 1926, II, 2470-1.—The process, which is patented (*German Patent* 415,587), is based on the reaction: $3(\text{NH}_4)_2\text{S}_2\text{O}_3 + \text{H}_2\text{SO}_4 \longrightarrow 3(\text{NH}_4)_2\text{SO}_4 + 4\text{S} + \text{H}_2\text{O}$. The reaction is carried out at 90° and proceeds at first rapidly but then comes to a stop when about 98% of the $(\text{NH}_4)_2\text{S}_2\text{O}_3$ is converted. The course of the reaction, which was followed by analysis with I periodically, is shown graphically. In 50% soln the undecompd. residue is 0.3%, in 5% soln. it is 4% of the $(\text{NH}_4)_2\text{S}_2\text{O}_3$. Only with 100% excess of H_2SO_4 is SO_2 evolved. The S which seps. is readily filtered or centrifuged and with pure reagents is obtained in pure form.

C. C. DAVIS

Production of soda products from sodium sulfate. P. A. CHEKIN. *J. Chem. Ind.* (Russia) 2, 664-5; *Chem. Zentr.* 1926, II, 1169-70.—Soda can be prepd. from Na_2SO_4 by the Leblanc or the Penjakow process. The latter process is based on the reactions $4\text{Al}_2\text{O}_3 + 4\text{Na}_2\text{SO}_4 + 2\text{C} \longrightarrow 8\text{NaAlO}_2 + 4\text{SO}_2 + 2\text{CO}_2$, and $2\text{NaAlO}_2 + \text{CO}_2 \longrightarrow \text{Al}_2\text{O}_3 + \text{Na}_2\text{CO}_3$. The first reaction proceeds at a bright red heat, the second reaction in water at room temp. Though the Penjakow process has advantages over the Leblanc process, it cannot compete with the Solvay process. It can, however, be utilized for the manuf. of NaOH. The NaAlO_2 is dissolved in water and agitated with freshly pptd. $\text{Al}(\text{OH})_3$. After 24-36 hrs. about 80% of the Al settles out as $\text{Al}(\text{OH})_3$ in a form which is readily sepd. The remainder of the Al is pptd. according to the reaction: $2\text{NaAlO}_2 + \text{Ca}(\text{OH})_2 \longrightarrow 2\text{NaOH} + \text{Ca}(\text{AlO}_2)_2$. The alkali liquor is concd. in the usual way and worked up, the ppt. is decompd. by boiling Na_2CO_3 soln. under pressure, the NaAlO_2 which is formed in soln. is decompd. by CO_2 and the $\text{Al}(\text{OH})_3$ returned to the process.

C. C. DAVIS

Transformation of sodium chromate into dichromate by means of carbonic acid. YA. R. GOLDSTEIN. *J. Chem. Ind.* (Russia) 1926, 564-6.—The exptl. results obtained by Yushkevich and Levin (C. A. 21, 3713) are incomplete and partly incorrectly explained. The fundamental condition of max. yield is the max. concn. of Na ion (whether in the form of chromate or dichromate) and the max. concn. of H ion of carbonic acid; the temp. has but an unimportant role.

BERNARD NELSON

Industrial sodamide. A. GUNTZ AND F. BENOIT. *Bull. soc. chim.* 41, 434-8 (1927).—Two samples of com. NaNH_2 gave the following analyses: NaNH_2 94.50, 80.50; NaH 1.85, 11.75; NaOH 3.25, 6.30; Fe 0.16, 1.60%. The presence of NaH accounts for variable results obtained in org. reactions when impure NaNH_2 is used and also presents a danger in the liberation of H when treated with H_2O in some reactions.

R. C. ROBERTS

Marine waters and the problem of potassium. III. Preliminary technological inquiries relative to the application of the Nicolli process. ENRICO NICOLI. *Giorn. chim. ind. applicata* 8, 603-10(1926); cf. C. A. 21, 2880.—As a source of the raw material for the process, true marine waters were found preferable to the brines of Mollake.

The curves of concn. of the given brines were detd. from the beginning of evapn. up to 38° Bé., with relation to vol. and av. evapg. velocity at the local temps. The mode of freeing from salts the impermeable argillaceous soils destined to form the evapg. basins for the pure solns. was studied. The source of supply for the industrial waters required in the process was found in an artesian well sunk to a depth of 232 m. R. S. P.

Preparation of alkali silicates from the chlorides. *L. HACKSPILL AND J. SALOMON. *Chimie et industrie Special No.*, 435-7 (May, 1927).—The reaction $\text{SiO}_2 + 2\text{NaCl} + \text{H}_2\text{O} \rightleftharpoons \text{Na}_2\text{SiO}_3 + 2\text{HCl} - 100 \text{ cal.}$ goes towards the right at high temps. (1000–1500°); but the rate of reaction is very slow at atm. pressure (on heating 5–6 g. of lump quartzite at 1000° in an atm. of NaCl and H₂O, 0.4% was transformed in 30 min.). Under reduced pressure the rate is greatly increased (reducing the pressure to 50–60 mm. in the above expt. resulted in a transformation of about 6% of the SiO₂). The use of finely divided SiO₂ (calcined gelatinous SiO₂) resulted in practically quant. conversion of the SiO₂ at a rate too rapid to be measured. The app. used for the lab. expts. is described, and the lines along which it would have to be modified to industrialize the process are discussed. A. PAPINEAU-COUTURE

The production of potassium salts from the rape of Crimea. S. I. VOLFKOVICH. *J. Chem. Ind. (Russia)* 1, No. 2, 27–32 (1925); *Chem. Zentr.* 1926, II, 810.—A survey of the present state of the trade and its possibilities. The production actually reaches several tons of KCl (raw product) yearly. A. L. HENNE

The exploitation of the magnesium lakes of the Crimean peninsula. S. F. ZHEMCHUZHNIU. *Ann. inst. anal. phys. chim.* 3, 370–8 (1926).—The water of lakes Staroe and Krasnoe contains 14–25% MgCl₂; of Kiyatskoe 10–18%; of Krugloe and Aigulskoe, 10–14%. The total MgCl₂ reserve is at least 1.5 million tons. It can be utilized in the manuf. of cement grindstones, etc. since sand and hard minerals are locally available. BASIL C. SOYENKOFF

Glauber's salt from Karabugas and its dehydration. A. I. KITAIGORODSKII. *J. Chem. Ind. (Russia)* 2, 666–8; *Chem. Zentr.* 1926, II, 1169.—In the winter months Glauber's salt appears in vast quantity on the shores of Karabugas (gulf of the Caspian sea). It contains no trace of Fe and only 0.03% MgSO₄ and CaSO₄. Though contg. normally 54.42% water, the temp. in the summer months frequently exceeds 32°, which is the temp. of conversion to the anhyd. salt so that in summer-time practically unlimited quantities of dry Na₂SO₄ can be obtained, without resort to artificial drying. C. C. D.

The composition of technical calcium hypochlorites and their behavior on heating compared with chloride of lime. HUGO DITZ AND RUDOLF MAY. *Z. Elektrochem. angew. physik. Chem.* 33, 265–72 (1927).—Ca hypochlorite (Griesheim) is analyzed by known methods, 78.88% active Cl being detd. These values are compared with the analytical values of Kast and Merz (*C. A.* 21, 1872) and Hofmann and Ritter (*C. A.* 8, 3275) for other hypochlorites. The active Cl in K. and M.'s detn. is about 10% lower than the others, owing, probably to incorrect methods. Values of K. and M. for the 60, 110 and 110/115 grades of chloride of lime show that they contain less than half the active Cl of hypochlorite. Ca hypochlorite is heated at 90°, 170–80° and red heat in a CO₂- and H₂O-free atm. The splitting off of Cl, with increase in temp., is not much greater, while the active Cl in the remainder is reduced from 78% at 90° to less than 1% at 170°. Expts. with hypochlorite contg. an equiv. amt. of CaCl₂ show that while at 90° the active Cl is 48%, at 150–60° it is reduced to 0.35% and a trace at red heat; the Cl given off increases from 1.5% to 5–6%. With decrease of CaCl₂ in hypochlorite there is a decrease in the Cl liberated, CaO having no effect. K. and M.'s results on the action of heat on chloride of lime, of H₂O at various temps. below 100° and the influence of CO₂ are given and compared with those of H. and R. J. BALOZIAN

Preparation and mechanical treatment of phosphates. I. M. VERKHOVSKII. *Trans. Inst. Fertilizers* 22, 3–80 (1924).—V. presents data showing that by roasting phosphate ore low in P₂O₅, then crushing the material and carrying it over picking belts which sep. the various sized pieces, screening and grinding in mills with air separations, a phosphate may be obtained which should run as high as 28% P₂O₅. An English résumé is given. J. S. JOFFE

Dehydration of metallic salt hydrates. I. Dehydration of sodium borate, carbonate and sulfate. M. A. RAKUZIN AND D. A. BRODSKI. *Z. angew. Chem.* 39, 1345–8 (1926); cf. *C. A.* 21, 3321.—Cold 95% alc. dehydrates completely the decahydrate of Na sulfate, has no effect on borax crystals, and removes about 75% of the water from Na carbonate decahydrate. Na sulfate is also completely dehydrated in 48 hrs. by 80% alc., and in 9 hrs. in a current of dry air at the ordinary temp. Na carbonate decahydrate is more slowly converted into the monohydrate in dry air at 15°, and on exposure to the atm. this compd. is converted into the stable dihydrate,

which is also the final product obtained by prolonged exposures of the decahydrate to the atm. Borax remains completely unchanged on exposure to damp or dry air for prolonged periods. The reason for the different behaviors of the 3 decahydrates is to be found in their heats of formation from the anhyd. salt; there are 36.0, 21.8 and 18.82 g.-cal. resp., for the borate, carbonate and sulfate. B. C. A.

The working up of thiocyanate liquors into carbon disulfide and ammonia. W. GLIUD AND W. KLEMP. *Ber. Ges. Kohlentechn.* 2, 54-8; *Chem. Zentr.* 1926, II, 2497.--To the paper by G., Keller and Klempt on the utilization of NH_4SCN (C. A. 20, 3687) should be added that PbS can be converted again into $\text{Pb}(\text{SCN})_2$ by treating with HSCN . It is considered possible at a suitable temp. to conduct a continuous stream of CS_2 and $\text{H}_2\text{S} + \text{HSCN}$ simultaneously over $\text{PbS} + \text{Pb}(\text{SCN})_2$. C. C. D.

The fixation of air nitrogen. ERICH KONTIG. *Teer* 25, 327-32(1927). -A general review covering the Frank-Caro, Haber-Bosch, Claude, Casale, Mont Cenis, Birkeland-Eyde, cyanide and nitride processes. F. S. GRANGER

A laboratory study of nitrogen fixation by the high-tension arc. P. G. COLIN AND HERMAN V. TARTAR. *J. Phys. Chem.* 31, 1539-58(1927); cf. C. A. 20, 2393.--The effect of reduced pressure on the yield of fixed N from an elec. arc was measured. The expts. were so conducted that the gas passed through the arc at const. velocity. There was a gradual decrease in concn. of NO and in the yield per kw-hr as the pressure was reduced. The pressure range covered was 200 to 700 mm Hg. The pressure at which a max. concn. of NO was obtained depended upon the current through the arc. The max. concns. of 8.8% NO for air, 12.2% for mixts. of 4 parts O and 1 part N, and 13.1% for mixts. of equal parts of O and N, were obtained at a pressure of about 100 mm. Hg. The law of mass action holds approx. for the reaction between O and N in the elec. arc at pressures greater than $\frac{1}{2}$ atm. It is probable that at lower pressures the thermal effects no longer predominate in the arc, but elec. effects give rise to deviations from the mass-action law. The concn. of NO cannot be increased by bringing the gases leaving the arc into contact with H_2O -cooled walls. R. L. DODGE

The fixation of atmospheric nitrogen as cyanide. BRUNO WAESER. *Metallbörse* 16, 2073-4; *Chem. Zentr.* 1926, II, 2836-7; cf. C. A. 21, 1872.--The formation of cyanide from coal satd. with alkali and N at high temps., which has long been known, has recently been applied with success in several places (Holland, England, U. S. A.) to the technical prepn. of alkali cyanides. All processes depend upon the conversion of alkali carbonate with coal in a current of N at 900-1000° in the presence of Fe as catalyst, alkali cyanide and CO being formed. The cyanide is purified by fusion, by lixiviation or by distn. from the final reaction product. Na_2CO_3 , K_2CO_3 or mixts. of the two can be used. The form of the alkali-coal mixt. (whether powder, briquets or otherwise), the fineness of the state of subdivision of the Fe and the velocity of the N current all have a determinative influence on the course of the reaction. Under favorable conditions, 100% conversion can be obtained in 30-60 min. BaCO_3 can be used in place of alkali carbonates, in which case it is highly compressed with coal and heated 15 min. at 1400°, which yields about 60% of cyanide. The cyanide is worked up into "pure cyanide" or is used for combating plant vermin. Cyanide is also used for the production of NH_3 , in which case it is treated with boiling water under pressure, NH_3 , Na_2CO_3 , H and CO being recovered in the final product. By combustion of H and CO with air, the N which is necessary in the cyanide process is readily obtained in a pure state. From a technical and an economic standpoint, however, it is disadvantageous for the Na_2CO_3 to be recovered in dil. soln. In this respect the use of BaCO_3 is preferable. It has also been shown by Hara and Miura (C. A. 19, 2112) that, when mixed with Na_2SO_4 or NaCl and Fe, BaCO_3 gives a good yield of NaCN in a short time at 1000°. By working up the BaSO_4 -NaCN or BaCl_2 -NaCN liquor from this process into NH_3 valuable by-products such as *blanc fixe* and NH_4Cl are also recovered. The production of NH_3 by the cyanide process is therefore worthy of consideration. C. C. D.

Absorption of nitrogen oxides in an aqueous suspension of phosphate rock. V. N. MORRIS. *Ind. Eng. Chem.* 19, 1143-7(1927).--The absorption of N oxides in concns. of 10-16% by wt. in suspensions of Florida phosphate rock in H_2O and various HNO_3 solns. has been studied. The oxides are converted for the most part into $\text{Ca}(\text{NO}_3)_2$ and the phosphate rock is converted into the H_2O -sol. form. The addn. of phosphate rock to the absorbing solns., particularly in those cases where a considerable concn. of HNO_3 has been formed, increased the degree of absorption of the oxides, unless too great a quantity of the rock has been added. The substitution of $\text{Ca}(\text{NO}_3)_2$ or $\text{Ca}(\text{H}_2\text{PO}_4)_2$ for an equiv. amt. of HNO_3 in the absorbing soln. causes an increase in the degree of absorption. Solns. of these salts are better absorbing media than H_2O alone up to certain concns. From a study of the solvent action on the phosphate rock it is indicated that

the first HNO_3 formed attacks some other Ca compd. more readily than it does the tricalcium compd.

J. H. PERRY

Advances in the inorganic heavy chemical industry in the years 1924-1926. II. BRUNO WARSER. *Fortschrittsber. Chem.-Ztg.* 1927, 84-100; cf. *C. A.* 21, 2762. E. J. C.

Manufacture of bromine from iron bromide. P. HÖFER. *Kali* 21, 222-4(1927).—Technical iron bromide, $\text{FeBr}_2 \cdot 2\text{FeBr}_3$, is oxidized to free Br and Fe_2O_3 when heated to $310-70^\circ$ in a current of air. The process proceeds in 2 phases, viz., the oxidation of FeBr_3 at 180° and the oxidation of FeBr_2 at about 310° . That FeBr_2 by ignition forms FeBr_3 and Fe_2O_3 , as asserted by Löwig, is, therefore, not considered probable, as FeBr_2 is the more stable and such a formation never was observed during the present expts. On addn. of oxidizing agents (KBrO_3) the formation of Br in the second phase took place at $270-80^\circ$ and could be completed more rapidly. An expt. which was interrupted at 225° showed that all FeBr_2 remained unchanged up to this temp., while FeBr_3 was partly oxidized directly to Br and Fe_2O_3 . An expt. interrupted at 300° showed that all FeBr_2 and only a small part of the FeBr_3 was oxidized. Calcd. on the amt. of Br introduced, the av. yield was 95% as free Br and 3.1% as HBr. The expts. are described in detail and the app. used is illustrated. Though technical iron bromide generally is employed as such in the manuf. of other Br compds. the present method is important where transportation of this material over long distances is concerned; the more convenient transportation of free Br may prove economical. D. THUESEN

Bauxite and aluminum in 1926. J. M. HILL. Bur. of Mines, *Mineral Resources of U. S.* 1926, Pt. 1, pp. 51-65 (preprint No. 6, publ. Sept. 10, 1927). Cf. *C. A.* 21, 1080. E. J. C.

Phosgene. A. KONOWALOW. *Z. ges. Schiess-Sprengstoffw.* 22, 152-5(1927).—Phosgene $b_{40} 8.2^\circ$, vapor pressure at 20° 1215 mm., $d_4 1.432$. Pumice adsorbs 1.3 times its wt. of phosgene. In Germany and America the war-time production was based on the combination of CO with Cl_2 ; C was used as a catalyst. In France and Italy the early war-time production was based on the action of H_2SO_4 on CCl_4 , later production on the CO- Cl_2 process. Phosgene is both asphyxiating and toxic. The lethal concentration for man is 2.5 parts in 10,000. A concentration of 0.36 mg. per liter is lethal in 30 min. Cases of retarded action are recorded. Hexamethylenetetramine with $\text{Na}_2\text{S}_2\text{O}_8$, Na_2CO_3 , or glycerol, and activated C are used in the chemical blowing of the gas mask canister for protection against COCl_2 . Methods of use of COCl_2 in warfare are described.

J. S. REICHERT

Liquid and solid carbon dioxide as a fire extinguisher. ED. FISCHER. *Z. anorg. allgem. Chem.* 26, 57-60(1927).

R. I. DODGE

German graphite, its importance and its production. W. LANDGRAEBER. *Zentr. Halbleit. Walze* 30, 369-71; *Chem. Zentr.* 1926, 11, 2005.—The crude graphite is ground and sifted and S compds. are removed by roasting and the product is converted into flake graphite, which is used chiefly for the manuf. of crucibles. The waste dust contains 20-35% C. It is made into graphite powder in the wet way, and has various uses. Recently the greater part of the flake graphite has been ground to powder to fill the demand.

C. C. DAVIS

New process for the regeneration of fuller's earth. L. GURVICH and V. GURVICH. *Vestnik Khimicheskoy* 8, 636-9(1925); *Chem. Zentr.* 1926, 1, 1781.—The more a solvent is adsorbed by an adsorption agent, the less is the solute adsorbed and retained by the adsorbent. As a measure of the avidity with which the solvent is adsorbed, the authors utilize the heat of wetting. With fuller's earth, the series: benzene < C_6H_6 < CHCl_3 < EtOH (cf. G., *C. A.* 17, 1570) was obtained. In conformity with this, more rosin was extd. from fuller's earth, which had been treated with a soln. of rosin, by CHCl_3 than by C_6H_6 , and more by C_6H_6 than by benzene. EtOH is a bad extn. agent, because it does not dissolve rosin. If, however, EtOH is used as an "agent of removal" and C_6H_6 as the solvent, excellent results are obtained. To 30 g. of fuller's earth which had adsorbed 2.383 g. rosin was added 7.5 g. EtOH and the mixt. was extd. in a Soxhlet app. with C_6H_6 . From the fuller's earth 2.372 g. of rosin was removed. The liquids used for extn. which were retained by the fuller's earth were expelled by heating at $130-140^\circ$. This treatment suffices for the complete regeneration of fuller's earth, and with such treatment it can be used repeatedly.

C. C. DAVIS

Investigations on the adhesive properties of potato flours prepared by various methods. W. EKHARD. *Z. Spiritusind.* 50, 246-7(1927).—Potato flour was prepd. by the following methods: distd. H_2O ; tap H_2O ; H_2O soln. of 6% SO_2 , added in the amt. of 25 g. per l.; H_2SO_4 in the concn. of 1° Ré. and 5° NaOH in the amt. of 1.5 g. per l. Each sample was divided into 2 portions, one being dried at 45° , the other at 30° . Cond. H_2O and SO_2 give the best results. NaOH is the poorest. The effect of

temp. during drying was not satisfactorily detd., but higher temps. seemed to give better results.

Physical properties of dental materials. IV. Cast gold alloys. R. L. COLEMAN. *Dental Cosmos* 69, 1007-26 (1927); cf. *C. A.* 20, 2897.—A study of (1) the chem. compn., melting ranges, tensile properties, and hardness of cast dental Au alloys, (2) the density and hardness of Au foil fillings, and (3) the microstructure of these materials. J. S. H.

Deterioration of structural steels in the synthesis of NH_3 (VANICK) 9. Demonstration of the Schoenherr-Hessberger nitrogen-fixation arc (FINCH) 2.

Ammonia. H. A. HUMPHREY. *Can.* 274,568, Oct. 11, 1927. A mixt. of N_2 and H_2 , in a predetd. ratio suitable for NH_3 synthesis, is produced by gasifying solid carbonaceous fuel continuously with highly preheated gas contg. steam and O_2 at a temp. so high that little or no CH_4 is formed, the compn. of the gas being controlled in such a manner that when exposed to a catalyst, it will contain H_2 plus CO and N_2 in the predetd. ratio in a CH_4 -free mixt. H is formed by interaction of CO with steam in presence of the catalyst, and the resultant gas mixt. is purified. This purified mixt. is passed over a hot NH_3 catalyst at a high pressure in a circulatory process in which gas not synthesized in its passage over the catalyst is again passed over the same catalyst.

Recovering ammonia from solutions of ammonium salts. E. L. RINMAN. *Swed.* 62,307, Feb. 1, 1927. The soln. is boiled with a Ca silicate, for instance portland cement.

Oxidation of ammonia with oxygen or similar gases. F. G. LILJENROTH. *Swed.* 61,836, Nov. 2, 1926. A part of the gas mixt. obtained by the oxidation, consisting chiefly of N oxides, water vapor and O_2 , is cooled and used for diluting the reaction gases.

Method and apparatus for the oxidation of ammonia. F. G. LILJENROTH. *Swed.* 61,699, Oct. 19, 1926. The oxidation is carried out gradually with intermediate cooling.

Cyanides. NAAMLÖÖZE VENNOOTSCHAP NEDERLANDSCHE MIJNBOW EN HANDELSMAATSCHAPPIJ. *Brit.* 262,802, Dec. 10, 1925. Humic acid or humates such as those of alkalies or Ba, with or without sawdust or other carbonaceous materials, are coked with alkali or alk. earth compds. with or without a catalyst, to form a mass which is then treated with N to obtain cyanides.

Continuous production of cyanogen compounds. O. STÅLHANE. *Swed.* 62,711, April 5, 1927. The charge consisting of C and compds. of alkali or alk. earth metals, with or without some catalytic substance, is passed through heated tubes in the presence of N. The tubes have small dimensions, no part of the charge being removed from the nearest part of the tube wall by more than 2-3 cm. preferably, and in no case by more than 10 cm. Cf. *C. A.* 21, 362.

Crystallizing salts or other substances from solutions. G. T. WALKER. U. S. 1,644,161, Oct. 4. A crystallizable soln. is passed through a container in which a const level is maintained with overflow discharge and the soln. is progressively cooled during its passage to effect satn. of the soln. and formation of crystals; the crystals are lifted and dropped through the soln. to assist crystal formation and are advanced through the container and discharged with the outflowing soln. An app. is described.

Ferric sulfate. B. HART. U. S. 1,644,250, Oct. 4. $\text{Fe}_2(\text{SO}_4)_3$ suitable for use as active material in the purification of oils, spirits and fats is prepd. by first treating Fe oxides with only sufficient H_2SO_4 to render the Fe content sol. and then adding sufficient H_2SO_4 together with an oxidizing agent such as a nitrate and MnO_2 to produce $\text{Fe}_2(\text{SO}_4)_3$.

Solidifying aluminum chloride. C. W. HUMPHREY and D. S. MCKITTRICK. U. S. 1,645,142, Oct. 11. AlCl_3 is heated above its triple point under a pressure sufficient to restrict vaporization and hold the body of AlCl_3 in liquid form and the temp. of the vapor is then reduced without corresponding reduction of pressure.

Purifying aluminum chloride. C. W. HUMPHREY and D. S. MCKITTRICK. U. S. 1,645,143, Oct. 11. AlCl_3 contg. Fe chloride or other chlorides is heated with Al to a temp. and pressure sufficient to liquefy the AlCl_3 and cause the Al to replace the Fe or other element of the chloride impurities. U. S. 1,645,144 specifies an app. for purifying and solidifying AlCl_3 .

Precipitating copper from sulfate solutions. N. C. CHRISTENSEN. U. S. 1,643,922, Sept. 27. A CuSO_4 soln. is treated with metallic Pb while continuously mechanically removing the coating of PbSO_4 formed upon the Pb, to ppt. Cu from the soln. and form a mixt. of Cu and PbSO_4 ; the constituents of the mixt. may then be sepd. by a differential solvent such as a concd. soln. of NaCl or CaCl_2 .

Potassium and aluminum compounds from ores. R. MOLDENKE. *Can.* 273,802,

Sept. 13, 1927. Ores contg. Al are treated with an acid capable of converting the Al and K and Na compds. into sol. compds. The K compd. is sepd. from the mixt. of sol. compds. and the Al is recovered in the form of an NH_4 alum.

Apparatus for the manufacture of ammonium chloride. G. H. HELLSING and O. L. CHRISTENSON. Swed. 62,668, March 29, 1927. A horizontal cylinder with double water-cooled walls and mech. stirring device.

Table salt. F. W. HUBER. U. S. 1,645,238, Oct. 11. In prepg. a "free running" salt, approx. equal vols. of highly concd. solns. of NaCl and CaCl_2 are mixed at approx. atm. temp. and well agitated so that most of the NaCl is pptd. as small crystals, the crystals are promptly sepd., dewatered, washed with brine, left moist after removing the washings, treated with a reagent such as Na_2CO_3 for pptg. the Ca salts present, thoroughly mixed and dried.

Water-cooled tuyère for soda furnaces. E. S. SANDBERG and F. I. F. GÖTHNER. Swed. 63,121, June 8, 1927.

Solid carbon dioxide. T. B. SLATE. U. S. 1,643,590, Sept. 27. Liquid CO_2 is conducted into a chamber under sufficient pressure to maintain the CO_2 in liquid state, the pressure is reduced in the chamber to convert a portion of the liquid CO_2 into a snow like condition, gaseous CO_2 formed is withdrawn, and the CO_2 snow is compressed into a dense mass. An app. is described.

Alumina. HÖGANÄS-BILLESOLMS AKTIEBOLAG. Swed. 62,581, March 15, 1927. A supplement to Swed. 59,865; C. A. 20, 803. The mother liquor from the pptn. app. is passed counter-current to the hot gases (water and HCl) from the calcination furnace. The gases are subsequently cooled, the condensed soln. of HCl being conducted to the decompu. app. or to the pptn. app. while the uncondensed gases are conducted to the pptn. app.

Tin oxides. K. B. HEBERLEIN. Brit. 263,034, June 11, 1926. Sn oxides such as contain small quantities of As or Sb are heated in solid form (preferably to 1000° or higher) with an alkali metal carbonate or a salt such as Na_2SO_4 , in quantity proportional to the impurities to be removed, and the product is ground and leached to remove sol. impurities. The process is especially applicable to the by-product obtained in treating impure molten Pb for the removal of As, Sn and Sb as described in Brit. 213,638 (C. A. 18, 2411).

Fluorine. NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 262,918, Nov. 28, 1925. Zr oxyfluoride or O-F compds. of Hf or Ti are heated in O or with an O-producing substance such as a pentoxide. The metal oxyfluoride may be made by evapg. a soln. of the fluoride almost to dryness and further drying *in vacuo* at 300° . An app. is described.

Hydrogen. G. CICALI. Can. 274,130, Sept. 27, 1927. A process for the removal of H₂ from water gas consists in previously removing a portion of the CO content, adding N_2 to the partially purified product, passing the mixt. through one of the pipes of a 3 pipe heat exchanger and then through liquid N_2 , whereby the CO liquefies and the H₂ escapes. The H₂ is delivered to another pipe of the heat exchanger and the volatile N_2 and CO are passed into the remaining pipe.

Carbon black. C. A. BARBOUR, JR. U. S. 1,643,736, Sept. 27. Hydrocarbon material such as natural gas is burned in a retort under a partial vacuum and with air proportioned to form free C; the C is sepd. and collected in the retort and the gases are then withdrawn. An app. is described.

Boiler for carbon-black retorts. H. R. ROGERS. U. S. 1,644,152, Oct. 4.

Sulfur burner. AKTIEBOLAGET KARLSTADS MEK. VERKSTAD. Swed. 62,031, Nov. 30, 1926.

Hardening colloids. A. MILLER. Can. 273,681, Sept. 6, 1927. A layer of a colloid, contg. uniformly distributed throughout it a substance which does not by itself harden the colloid, is treated with another substance, which is also incapable of hardening the colloid, but which reacts with the first-named substance, even without exposure to light, to form a hardening agent.

Condensation products of phenols and formaldehyde. E. J. P. C. DE JARNY. U. S. 1,643,447, Sept. 27. Alk. earth chlorides are used as catalysts in a quantity exceeding 15% that of the CH_2O soln. used for the condensation, to form plastic masses, cold-kneadable and sol. in acetone and in alc. The soly. decreases as the reaction proceeds without the kneadability being substantially affected.

Plastic compositions containing condensation products of formaldehyde and urea. I. G. FARBENIND. A.-G. Brit. 262,818, Dec. 14, 1925. Plastic masses, lacquers, etc., are formed by adding to urea CH_2O condensation products, preferably in an org. solvent, non-volatile or difficultly volatile substances (such as cellulose esters or ethers,

with or without plasticizing or softening agents, and natural or artificial resins) capable of forming solid solns. with the condensation products. Examples are given.

Casein compositions. W. J. HOLLOCK. Brit. 262,929, Dec. 10, 1925. Homogeneous dried pressed articles are formed by treating a tannin ext. with lime, filtering off the ppt. and mixing the filtrate with casein, $(\text{NH}_4)_2\text{CO}_3$ and paper.

Burning lime with bituminous alum slate. G. H. HULTMAN. Swed. 61,760, Oct. 19, 1926. By means of artificial draft the burning is made to proceed in the downward direction in the kiln in order to make possible the recovery of valuable by-products such as oil and sulfur.

Impregnating porous materials. A. E. EBBESSON. Swed. 63,324, July 12, 1927. The materials are treated in a closed chamber with vapors of suitable impregnating substances such as resin, asphalt, paraffin, etc., at suitable temp. and pressure. When the materials are cooled the vapors will be condensed in and on the walls of the pores without considerably changing the size of the pores.

Coating porous articles with metals. J. B. STÅLHANE. Swed. 62,329, Feb. 1, 1927. The pores of the article are filled with a suitable substance and the surface to be coated is ground in order to remove the adhering filler. After the coating has been applied the filling substance is removed by leaching with water, melting, heating with gas or in other ways in order that the article shall regain its original porosity.

Detergent composition. C. W. EBBERT. U. S. 1,644,053, Oct. 4. Cleaning cloths are treated with a soln. formed of pine oil, NH_4 oleate, NH_3 and H_2O and mixed with tripoli; the cloth is stretched and dried and is then treated with a camphor soln.

Polish. F. Y. P. LAN. Can. 274,177, Sept. 27, 1927. Lime 4, NH_3 3, gasoline 4, H_2O 16 and salt 2 oz. are mixed together, the liquid is strained off, and the product is alternately washed and strained to form a paste.

Fabric cement. N. C. AMEN. U. S. 1,643,437, Sept. 27. A cement suitable for use in repairing tents or awnings, etc., is formed of nitrocellulose 18, C_6H_6 45, "methyl acetone" 37 parts and a small proportion of BuOAc .

Machinable composition nonconductive of electricity. MARC DARRIN. U. S. 1,644,711, Oct. 11. A hard compn. adapted for use in making various articles is formed from cellulosic material such as paper pulp 20-35%, the remainder of the compn. being chiefly S, together with triphenyl phosphate, C_{10}H_8 , $\text{C}_{14}\text{H}_{10}$ or other substances.

Stencil sheet. SHINJIRO HOKRI. U. S. 1,645,141, Oct. 11. Sheets such as yoshino paper are impregnated with a compn. comprising esters of polysaccharides, e. g., mannan acetate, cellulose nitrate or acetate and chlorinated C_{10}H_8 derivs. Cf. C. A. 21, 3459.

Molding and coloring dolls or other articles formed from celluloid or similar materials. ALBERT BEYLER. U. S. 1,645,275, Oct. 11.

Rendering of non-cohesive substances cohesive. F. W. V. FITZGERALD. Can. 274,338, Oct. 4, 1927. Substances such as shredded asbestos fiber or powdered mica or slate are rendered cohesive by mixing with com. borax or similar H_3BO_3 compd. and subjecting to pressure and heat, and then subjecting the molded substance to a higher temp.

Pipe composition. A. A. POPE. Can. 274,176, Sept. 27, 1927. A pipe compn. in liquid form consists of Na_2SiO_3 thoroughly mixed with asbestos and talc, together with suitable coloring matter.

Multiply reinforced paper material impregnated with asphalt or other waterproofing substances. W. H. CADY. U. S. 1,644,050, Oct. 4.

Material for stiffening boots and shoes, etc. BRITISH UNITED SHOE MACHINERY CO., LTD. Brit. 262,838, July 7, 1925. A felt made of paper pulp mixed with longer fibers such as cattle hair is mixed with thermoplastic material such as gilsonite, montan wax and emulsified asphalt. Casein, resin size and other substances also may be used.

Lining for dental plates. E. K. PETERS. U. S. reissue 16,754, Oct. 4. See original pat. 1,589,552; C. A. 20, 3065.

Photo-mechanical printing surfaces. U. OSTWALD. Brit. 262,793, Dec. 8, 1925. In order to prevent undesirable swelling in making gelatin, albumin or glue surface printing-surfaces, the H_2O -absorbing property of the layer is reduced and its strength is increased by incorporating a non-precipitant addn. for coating individual "cells" of the layer material, e. g., a soln. of collodion in HOAc may be added to a soln. of gelatin in concd. HOAc . Various other details are given.

Gelatin for photomechanical printing surfaces. SANDOR GES. Brit. 263,125, Dec. 18, 1925. Gelatin used for making printing surfaces is treated (together with the wetting medium) with substances, such as Na_2SO_4 in decinormal soln., which reduce its swelling property and obviate the formation of elevated reliefs. The wetting medium is heated above 22° to prevent the high lights taking up greasy ink.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Concerning new problems in the production of commercial glasses. Mechanical homogenizing and the correct heat-treatment history. F. ECKERT. *Bulletin Am. Ceram. Soc.* 6, 306-8(1927). C. H. KERR

Phonolite in the manufacture of glass. W. LIEBIG. *Sprechsaal* 59, 284-5; *Chem. Zentr.* 1926, II, 95.—A discussion of various phonolites and their suitability. C. C. DAVIS

Taylor studies of the technical analyses of the raw materials for glass. II. Mineral potash. DOROTHEA JAPHE. *Sprechsaal* 60, 403-7, 424-7(1927); cf. C. A. 20, 3217.—Short methods are given for the detn. of potash salts. R. A. HEINDL

The stability of glasses in the soda-lime-silicic acid system. G. KEPPELER AND H. IPPACH. *Sprechsaal* 60, 239-41, 261-4, 281-4, 297-300(1927).—A complete review and study was made on the relation between compn. and stability of glasses in the $\text{Na}_2\text{O}-\text{CaO}-\text{SiO}_2$ system. The powder method was used in the leaching tests, a no. of labs. cooperating in making tests on glasses using this method. On the basis of the extn. detn., curves for all glasses of equal stability in the $\text{Na}_2\text{O}-\text{CaO}-\text{SiO}_2$ system were detd. and which contained the characteristic "isohydrolites." The limits of the compn. were fixed of those soda-lime-silica melts which can be commercially melted. R. A. H.

The stability of alkali-lime glass. OSCAR KNAPP. *Sprechsaal* 59, 199-201(1926); *Chem. Zentr.* 1926, II, 95.—The stability is a constitutive and additive property. C. C. DAVIS

The relation of the composition of glass to its optical constants. II. Potash-lime glass. TORU TAKAMATSU. *Repts. Imp. Ind. Research Inst. Osaka, Japan.* 8, No. 5, 1-35(1927), cf. C. A. 20, 2730.—Optical consts. of $\text{K}_2\text{O}-\text{CaO}$ glass having the compn. $X\text{K}_2\text{O} \cdot Y\text{CaO} \cdot 6\text{SiO}_2$, in which X and Y are variables, have been detd. and the following conclusions were reached. When CaO and SiO_2 are kept const., the values for n_D , n_C and n_F increase in a straight line with the increase in K_2O . The av. increase for n_D is 0.001 per 0.1 mol. K_2O . If the sum of mol. concns. of K_2O and CaO is above 2.4 the curve for n_D is a hyperbola. The total dispersion increases also in a straight line with an av. of 0.00005 per 0.1 mol. K_2O , while the γ value decreases with an av. of 0.23 per 0.1 mol. of K_2O . In case CaO is varied while the others are kept const. the same regular changes were noted. Thus, with an addn. of 0.1 mol. CaO an av. increase of 0.0025 is noted for n_D , of 0.000065 for total dispersion and an av. decrease of 0.192 for γ value. When the sum of the mol. concns. of CaO and K_2O is above 2.4, the curve for n_D is a shallow hyperbola, while those for other consts. remained straight. NAO UYBI

Changes taking place in optical glasses. P. NICOLARDOT. *Rev. gén. colloïdes* 5, 445-9, 491-6, 539-43, 592-8(1927).—A review. A. PAPINEAU-COUTURE

The absorption of optical glasses and borax below 4.1μ . TH. DREISCH. *Z. Physik* 42, 428-34(1927).—The absorption of optical glasses is extremely small up to 2.7μ ; from this point it is very much increased. In glasses contg. H_2O_3 there are sharp bands at 2.8, 3.68 and 4.05μ ; the strength of these bands is incrd with increasing amounts of B_2O_3 . They correspond to the bands of borax at 2.95, 3.65 and 4.1μ . The SiO_2 content of the glasses causes diffused bands at 2.85 and 3.55μ . J. A. S.

The absorption of quartz and quartz glass below 4.1μ . TH. DREISCH. *Z. Physik* 42, 426-7(1927).—The quartz band at 2.9μ used for adjustment is not as sharp as is generally supposed; it shows fine structure. The quartz has 3 max. at 2.91, 2.97 and 3.02μ . The quartz glass shows a very intensive max. at 2.75 , which is better suited for adjustment purposes than the band of the cryst. quartz. The quartz glass used was pure SiO_2 from Heraeus, the difference in the band of the two is caused by the destruction of the crystals during fusion. Between 3.1 and 4.1μ the two absorption curves are identical; at 3.75μ there is a band which is so far unknown. J. A. SZILARD

Design and service of (glass) tank blocks. D. W. ROSS. *J. Am. Ceram. Soc.* 10, 774-83(1927). C. H. KERR

The compounding of lead glasses. OSCAR KNAPP. *Sprechsaal* 60, 226-8, 242-3(1927).—A discussion with data in connection with K.'s work on "The Keppeler Principles of Lead Glasses." R. A. HEINDL

The course of the crack in the breaking up of solid (lump) glasses through blow or impact. HANS JEBSEN-MARWEDEL. *Sprechsaal* 60, 317-21(1927).—A technical analysis of the fracturing of solid lump glass due to impact. R. A. HEINDL

The storage and packing of glassware. G. GEHLHOFF AND R. SCHMIDT. *Sprechsaal* 60, 336-40, 353-6(1927).—The harmful effects of moisture absorbed from the atm. on glasses of different compns. were investigated. Photomicrographs illustrating these effects as well as those due to packing materials are given. R. A. HEINDL.

Method for complete [glass] sand analysis. STANDARDS COMM., GLASS DIV., AM. CERAM. SOC. *Bulletin Am. Ceram. Soc.* 6, 321-4(1927).—A method is given in detail for CaO, MgO, ignition loss, Fe₂O₃, TiO₂, ZrO₂, Al₂O₃, SiO₂. C. H. KERR

The technical development of the ceramic industry. ANON. *Industrieldningen Norden* 55, 394-7(1926).—A review. C. A. ROBAK

The role of the ceramic petrographer. A brief review of the development of the ceramic petrography. A. B. PECK. *Bulletin Am. Ceram. Soc.* 6, 297-305(1927).

C. H. KERR

Dry grinding clay to eighty-mesh. D. F. ALBERY. *J. Am. Ceram. Soc.* 10, 804-6(1927).

C. H. KERR

The manufacture of green gold. F. CHEMNITIUS. *Sprechsaal* 60, 313-4(1927).—A discussion on the manuf. of gold preps for ceramic purposes including a diagrammatic sketch showing substances and their relative position to one another which enter into reactions leading to the formation of green and burnished gold. R. A. HEINDL

The role played by water in the forming of clay objects. HERMANN SALMANG AND ALFRED BECKER. *Sprechsaal* 59, 389-90, *Chem. Zentr.* 1926, II, 1321.—By mixing kaolin with liquids of different compns., it was found that only with liquids which contain acid or alc. groups can plastic masses be formed. The H₂O which is represented in each type of compd. (H, OH) may play a part in the plasticizing in virtue of its chem. nature, for hydrocarbons have no plasticizing action. Besides the chem. nature of a liquid, the viscosity of the liquid detcs. its plasticizing action. Substances which can be molded only with difficulty, e. g., steatite and mica in a very fine state of subdivision, show the same properties as kaolin, but to a less extent. With these substances, the viscosity plays a more prominent part in the plasticizing action. Graphite, which has no chem. affinity, can be formed into a plastic mass only with viscous liquids. The results show that chem. action plays a part in molding clays and kaolins. C. C. D.

Steatite porcelains. LADISLAUS VON PUTNOKY. *Chem. Rundschau Mitteleuropa Balkan* 3, 66-9; *Chem. Zentr.* 1926, II, 1321.—Steatite products from the pure powder must be baked at 1450°, whereas a thick object in which there is also 15-30% clay and water can be baked at 1200-1300°. Such products can be manufd. more cheaply than ordinary porcelain products, shrink less and possess great elasticity. Products intermediate between pure steatite and steatite porcelains can also be made. C. C. D.

Waste-heat boiler plants attached to circular ceramic furnaces. ED. FROMME. *Arch. Warmewirt.* 8, 279-82(1927).—The installation illustrated and described recovered 53% of the heat in the fuel used. ERNEST W. THIBLE

Electric kilns at the Gustavsberg works. A. S. W. ODELBURG. *Trans. Ceram. Soc. (Eng.)* 26, 61-73(1927).—Data are given on the elec. firing of porcelain cups. H. F. K.

New viewpoints in the use of refractory construction in the metal industry. K. ENDELL. *Metall u. Erz* 24, 225-30(1927).—Discussion of the drying of Zn stills and the use of tests based upon resistance to change of temp., high temp., and chem. corrosion. Drying should include consideration of the vapor pressure of the H₂O in the mold, the humidity and velocity of the air and the phys. consistency of the mold. C. G. K.

Notes on the analysis of refractories. W. J. REES. *J. Soc. Glass Tech.* 11, 172-6(1927).—While the usual methods applicable to the analysis of glass can be applied to most refractories, greater care must be observed in preventing contamination in the prepn. of the samples of refractories. In the SiO₂ detn. after Na₂CO₃ fusion it is shown that the Fe₂O₃ and TiO₂ impurities taken up increase progressively from 6 to 11 mg. and 2 to 3 mg., resp., as the baking temp. after evapn. to dryness is increased from 105° to 120°. With refractories of bauxite the TiO₂ contained in the SiO₂ residue may be 12-15 mg. The Al(OH)₃ pptn. from a soln. neutral to methyl red is most convenient. The wash soln. suggested contains per l. 5 cc. concd. HNO₃ neutralized with NH₄OH. The other constituents are detd. as usual. The short method of analysis of SiO₂ brick is: Treat with HF and H₂SO₄ twice for SiO₂ detn., digest the residue with strong NH₄OH, filter, evap. the filtrate, and add 50 cc. Gooch and Eddy's soln. contg. NH₃ and (NH₄)₂CO₃ in an alc. soln., filter, evap. to dryness and det. the alkalis as mixed sulfates. With MgO refractories it may be necessary to fuse with Na₂CO₃ since the dead burnt MgO is slowly sol. in HCl. For the detn. of Al₂O₃ in chrome refractories R. advises Na₂O fusion, followed by the pptn. of Al as the basic carbonate with a slow stream of CO₂ overnight. Steam under pressure was not successful in opening up the silicates of re-

fractories. Na_2O_2 fusion is necessary in dissolving sillimanite and mullite for analysis.

Analysis of high-alumina clays and refractories. W. SINGLETON. *Chem. Age* (London), *China Clay Trade Review Sec. 17*, No. 420, 6; No. 425, 6-7(1927).—Details of procedure are given, with slight modifications of well-known methods. C. H. K.

Notes on cyanite and diaspore refractories. H. J. VACHUSKA AND G. A. BOLE. *J. Am. Ceram. Soc.* 10, 761-73(1927).—Mixts. of diaspore and cyanite, diaspore and clay and cyanite and clay were tested. Results are tabulated and discussed. Burns were made at cones 12, 16, 20 and 28. Adding 20% or more cyanite to diaspore tends to counteract the shrinkage of diaspore during continued use at high temps. C. H. K.

Experience with refractories in furnace construction. L. W. BRIGGS. *The Clay-Worker* 88, 194-5(1927).—Some of the factors affecting the life and use of refractories and the probable lines of development are indicated. L. B. MILLER

Magnesia refractories for steel furnaces. G. M. CARRIE AND C. F. PASCOE. *Can. Mining Met. Bull.* No. 186, 1186-1272(1927).—A discussion of uses, properties, comparison with other refractories, application in steel furnaces, and service in operation. A. BUTTS

Spalling and loss in compressive strength of fire brick. H. R. GOODRICH. *J. Am. Ceram. Soc.* 10, 784-94(1927).—Loss in compressive strength after thermal shock seems to be a good means of detg. resistance to spalling. Bricks with high quartz content in kaolin bonds showed low initial crushing strength, but retained a higher % of its strength after thermal shock than did the fireclay types (testing at 1350°). In tests at 1250° individual characteristics rather than type properties prevailed. A vitrified or brittle structure showed the poorest resistance to spalling. C. H. KERR

A study of flue lining [in chimneys]. R. A. HART AND H. W. CLARK. *J. Am. Ceram. Soc.* 10, 795-803(1927). C. H. KERR

A preliminary study of ceramic colors and their use in vitreous enamels. W. N. HARRISON AND T. D. HARTSHORN. *J. Am. Ceram. Soc.* 10, 747-60(1927). C. H. K.

Principal observations to be noted in the cooling of enamels. TH. SCHAUER. *Sprechsaal* 60, 238-9(1927).—The following conclusions are given which will lead to the improvement of enamels: the amt. of crystn. of the enamels should be reduced to a min.; control of time and temp. of annealing corresponding to the enamel used permit the greatest development of cast pearlite; uniform cooling in such a manner as to eliminate large temp. differences between enamel and Fe. R. A. HEINDL

Enamel colors resistant to acids and their testing. EISENLOHR. *Sprechsaal* 59, 645-6; *Chem. Zentr.* 1926, II, 2472.—The resistance to acids of enamel colors does not increase with increasing SiO_2 content. All enamels contg. between 1.3 and 2.0% SiO_2 to 0.7 PbO + 0.3 Na_2CO_3 are resistant to acids. Acid-resistant enamels give up only 0.1-0.01 as much to acids as ordinary enamels. They are tested with 3% HCl in which the baked enamel is immersed for at least 5 hrs. This treatment should not detract from the brilliancy of the enamel, even when it is thick. C. C. DAVIS

Uranium oxide colors and crystals in low temperature glaze combinations. J. R. LORAIN. *J. Am. Ceram. Soc.* 10, 813-20(1927).—By using only U_3O_8 and Pb_3O_4 it is possible to produce any shade from yellow to dark orange or red. About 10% of yellow U_3O_8 will produce deep orange. Volatilization of Pb is an important factor in crystal growth. C. H. KERR

The salt glaze. BERNHARD NEUMANN AND WERNER FISCHER. *Sprechsaal* 60, 294-7, 314-7, 331-4, 349-52(1927).—An extended investigation on the reactions of NaCl with the various substances making up bodies of salt-glazed articles and the effect of steam as well as either reducing or oxidizing atm. R. A. HEINDL

General notions on the glazed earthenware. L. DELOYERS. *Bull. soc. chim. Belg.* 36, 55-63(1927).—An address. A. L. HENNE

Why is it impossible to obtain deep, bright, full colors (tints) in cover glazes (enamels, etc.)? JOSEF WOLF. *Sprechsaal* 60, 219-26(1927).—When cover glazes were used as ground coats, no deep bright colors were obtained as with transparent glazes. The reason why no deep full tints are obtained with opaque (white) enamels may be found in the strong reflection of such enamels. R. A. HEINDL

The determination of boric acid in silicates (SCHMIDT) 7. The analysis of silicate slags (COLCLOUGH) 7. Waste heat utilization (WADE) 13. Arsine from fused glass (ELSEY) 2.

Sheet glass. L. SHOWERS. U. S. reissue 16,755, Oct. 4. (Original pat. 1,603,989; C. A. 21, 164.) Mech. features.

Forming sheet glass. G. E. HOWARD. U. S. 1,645,053-4, Oct. 11.

Apparatus for making sheet glass. H. R. SCHUTZ. U. S. 1,643,680, Sept. 27.

"Unsplinterable" glass. E. HOPE. U. S. 1,644,131, Oct. 4. Glass sheets are united with an intervening sheet of cellulose acetate or other suitable cellulose ester, by the use of a polymerized itaconic ester, *e. g.*, polymerized di-alkyl esters of itaconic acid.

Treating glass with stannous chloride and silver-depositing solutions. E. D. TILLYER AND H. R. MOULTON. U. S. 1,644,798, Oct. 11. Glass such as is to be treated with a Ag soln. for producing markings on the glass is preliminarily treated with a soln. of SnCl_2 in order to form markings rendered visible by moisture or developed by dil. Ag solns., etc.

Protecting silvered glass. SOC. ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE ST.-GOBAIN, CHAUNY, ET CIREY. Brit. 262,824, Dec. 14, 1925. The silvered surface is coated with a soln. of a synthetic resin in a solvent having a b. p. lower than 100° and the glass is then heated to polymerize the resin.

Feeding charges of molten glass. WM. T. BAKER, JR. U. S. 1,645,221, Oct. 11. Mech. features.

Device for feeding molten glass. K. E. PEILER. U. S. 1,644,893, Oct. 11.

Glass-molding machine. AKTIEBOLAGET SURTE-LILJEDAHL. Swed. 62,850, April 27, 1927.

Discharge control device for glass furnaces. D. S. BEEBE. U. S. 1,643,601, Sept. 27.

Removing gas from melted glass or quartz. C. A. F. BENEDICKS. Swed. 63,106, June 8, 1927. The melted mass is stirred by means of a rod or other article hotter than the glass bath; the sepn. of the gases is localized on this stirrer.

Porous clay product. E. I. LINDMANN. Swed. 62,968, May 10, 1927. Clay from quaternary deposits is heated with successive increases in temp. to a temp. near the m. p., then more slowly until the mass reaches a state of viscous fusion in order to facilitate the expansion of the inclosed gases; after this the burning is discontinued.

Porous bricks, etc. F. C. KERN and F. E. KERN. Brit. 262,826, Dec. 14, 1925. Sawdust or other fibrous material which is to be mixed with clay and subsequently burned out to leave a porous product is heated to $200-325^\circ$ either before or after admixt with the clay but before molding, in order to volatilize moisture and other volatile substances which would tend to cause rupture of the material in burning. Substances such as fuller's earth, kieselguhr, silicic acid or bentonite also may be added. Cf. C. A. 20, 3340.

Tile. E. G. BARRATT. U. S. 1,645,214, Oct. 11. Tiles are formed with a main body of gypsum plaster, a fibrous cover sheet and a coating of paint enamel over the fiber sheet.

Aggregate for use in making brick or other molded articles. S. J. HAYDE. U. S. reissue 16,750, Sept. 27. Clay, shale, shale rock or other raw argillaceous material contg. a lime-forming substance is burned, mixed with H_2O to slake the lime present, and the product is crushed. (See original pat. 1,255,878; C. A. 12, 986.)

Clear vitreous silica. H. L. WATSON. U. S. 1,645,080, Oct. 11. Cryst. SiO_2 is heated *in vacuo* to a temp. sufficient to effect fusion and is then heated for a short time to above 2000° in the presence of air or other suitable gas under substantial pressure, *e. g.*, at 2300° under atm. pressure.

Forming silica tubing from rods. E. R. BERRY and P. K. DEVERS. U. S. 1,645,086, Oct. 11.

Abrasive sheet. G. E. BEHR, JR. U. S. 1,645,037, Oct. 11. A sheet such as paper is impregnated with cottonseed oil or other suitable waterproofing agent and the abrasive grit is held to the sheet by a separately applied and different material which is miscible with the impregnating medium, *e. g.*, a mixt. of tung oil, linseed oil, rosin and gasoline.

Refractory material. M. L. FREED. U. S. 1,644,244, Oct. 4. A material suitable for furnace linings and like uses is prepd. by calcining a compn. contg. topaz and an anhyd. Al silicate to cause conversion to mullite, molding the mullite with a temporary binder and then firing at a temp. which will convert the particles into a homogeneous mass.

Refractory material. G. B. LUCKETT and J. A. JOHNSON. U. S. 1,643,988, Oct. 4. A refractory coating material adapted for use as a mortar with clay and SiO_2 brick comprises acetylene plant waste (mainly Ca(OH)_2) of a thick creamy consistency 1 gal and NaCl 1 oz.

Forming refractory linings for electric furnaces. D. L. SUMMEY. U. S. 1,643,425, Sept. 27. Mech. features.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Investigations of the constitution of portland cement. ERNST JÄNECKE. *Tonind. Ztg.* 51, 1246-7(1927).—The importance of the mineral jänneckite, $8\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$, in portland cement is reiterated. Cf. *C. A.* 20, 3068. F. O. A.

Aluminous fused cement and its application for reinforced concrete construction and stucco. ORTHAUS. *Tonind. Ztg.* 51, 1130-5, 1151-3(1927).—After making careful tests, considerable amts. of aluminous cement were used around a gas works to very good advantage where its high early strength, even in cold weather, as well as its resistance to sulfate waters were deciding factors in its choice. Applied as stucco best results were obtained on portland concrete at the age of 14 days or on aluminous concrete at 21 hrs. Reports are given of extensive and successful patching of old corroded portland concrete. F. O. A.

Roads to supercements. HANS KÜHL. *Tonind. Ztg.* 51, 1245-6(1927).—The proper grinding and mixing of the raw materials and the correct burning and grinding of the clinker are important as well as the chem. compn. Too fine grinding of the clinker may result in flash set, or in too bulky a cement or may increase laitance. It is suggested that the fact of the low tensile strength relative to the compressive strength may be taken as an indication of concealed unsoundness in present-day high-lime supercements. The early strength of Velo cement is obtained by increasing both the silica and lime with the addn. of some fluorspar to control the burning temp. In Kühl cement Fe and Al are high while silica and lime are a little low. In Novo cement CaCl_2 seems to play an important role. The future lies in searching for catalysts or promoters but the lack of scientific knowledge of the hydration and hardening processes hinders the search. F. O. ANDEREGG

Physical transformations undergone by cement during hardening. CESARE ZAMBONI. *Giorn. chim. ind. applicata* 8, 469-72(1926).—The quality of a cement depends upon its property of combining in the smallest possible time with a large amt. of H_2O , since the greatest compactness is immediately reached and hence the greatest resistance to compression. The greater the fineness, the more rapid is the hardening. To a greater resistance there always corresponds a strong diminution of the sp. gr.; hence there is a greater increase of vol. with relatively greater compactness. The difference in the sp. gr. of an agglomerate and that of the same material after hardening for a given time in H_2O is a criterion of its resistance. As an alternative, the difference in sp. gr. of a cement after 24 hrs. in intimate contact with H_2O and that after 48 hr. contact gives a measure of its intrinsic value. The cement will show a greater resistance, the greater the decrease in sp. gr. between these 2 periods. The system of calcination of the cement, i. e., the use of different kinds of kilns, has an appreciable influence upon the quality of the cement. ROBERT S. POSMONTIER

The tensile strength of cement and its significance for building purposes, especially for early-strength cements. H. SPANGENBERG. *Beton Eisen* 26, 16-9(1927).—The tensile strength of early-strength cements often does not increase as rapidly as the compressive strength; reliance placed upon the latter kind of results might lead to misapplication where the tensile strength is the more important property. The desirability of also making tensile tests as is done in America is emphasized. F. O. A.

The tensile strength of hydraulic cements. CARL BIEHL. *Tonind. Ztg.* 51, 1253-5(1927).—The ratio of compressive to tensile strength tends to approach a const. value in time. The ratio is helped by a correct choice of aggregates. F. O. A.

Standards for portland cement. HÄGERMANN. *Beton Eisen* 26, 153-4(1927).—General remarks. F. O. A.

Ring and ball formation in the rotary kiln. H. RICHARZ. *Tonind. Ztg.* 51, 1257-61(1927).—No positive conclusions. F. O. A.

The effect of water on the recrystallization of slightly soluble substances. B. GARRE. *Tonind. Ztg.* 51, 1440-2(1927).—Pellets 10×7 mm. were compressed at 715 kg. using: (1) quartz powder, (2) pptd. Al_2O_3 , (3) fused Al_2O_3 , (4) CaCO_3 , (5) Na_2CO_3 , (6) $10\text{Na}_2\text{CO}_3 + 90\text{Al}_2\text{O}_3$, (7) CaF_2 , (8) $10\text{CaF}_2 + 90\text{Al}_2\text{O}_3$, with varying amts. of water at room temp., at 500° and at 900° . The strength and pore space were observed. The latter decreases as more water is added. The strength usually increases with the water and with heating, except the strength developed at 500° by (1). Both 1 and 3 give low strengths while 2 and 4 yield fairly good strengths. The amt. of water absorbable depends upon the grain size. F. O. ANDEREGG

The testing of protective coatings for concrete. RICHARD GRÜN. *Tonind. Ztg.* 51,

1253-5(1927).—A series of tarry and asphaltic materials suitable for applying to concrete was examined for appearance, compn., sp. gr., workability and spreading power, tenacity, drying capacity, strength, elasticity, compactness, and resistance against heat, moisture and chemicals. A preliminary set of standard specifications is outlined.

F. O. ANDEREGG

Early-strength cement and concrete. SPINDEL. *Beton Eisen* 26, 9-16(1927).—General remarks on the history of early-strength cement in which S. played an important part. Also a good description of present-day practice in central Europe. S. emphasizes the necessity of having a proper clinker for high-grade cement and points out that the quality tends to improve often up to fusion. The new Kühl cement is described with some enthusiasm.

F. O. A.

Highest early-strength mortar and concrete. SPINDEL. *Beton Eisen* 26, 111-3(1927).—By the use of high-grade cement and certain admixts. (not given) it is claimed that the securing of the old 28-day strength is possible in 6 hrs.

F. O. A.

Mistaken conception and rules for concrete making. SPINDEL. *Tonind. Ztg.* 51, 1325-7(1927).—Some mistakes in practice include the old idea that a long curing period is necessary before removing forms, the use of the ideal curve or void method for proportioning the aggregates, and the viewpoint that the water-cement ratio is the whole story in making good concrete.

F. O. A.

Temperature developed in high-alumina concrete. T. H. CUTLER. *Eng. News-Record* 99, 146(1927).—A curve is given showing the temp. developed in high-alumina cement concrete poured when the air temp. was slightly below freezing.

R. H. T.

Quality design and control of concrete. J. A. KITTS. *Eng. News-Record* 99, 232-3(1927).—Essential control measures for producing quality concrete with economy are outlined.

R. E. THOMPSON

Influence of the water-cement ratio on the strength of concrete. F. R. McMILLAN. *Contract Record Eng. Rev.* 41, 554-5(1927); cf. *C. A.* 21, 1695.—Expts. are described which show that concrete of uniform strength of any desired workability can be obtained by keeping the water-cement ratio const. and varying the mix, whereas workability is only obtained at the expense of quality when additional water is employed.

R. E. THOMPSON

Method for testing bond between concrete and its reinforcing. R. C. DURST. *Eng. News-Record* 99, 402(1927).—A brief description of a simple method for detg the bond between concrete and steel reinforcing consisting of carrying out the test in the usual manner on specimens prepd. in pipe sections 3 in. in diam. and 8 1/2 in. long. This prevents compression of the concrete which probably exerts a pressure against the rod.

R. E. THOMPSON

The significance of the cement stone in poured concrete. GAYE. *Beton Eisen* 26, 237-44, 270-3(1927).—The production of concrete is considered from the standpoint of the cement combining with water to form a stone which binds the aggregate into a hard mass. The effects of the cement-water ratio and the addn. of fine rock powder are discussed.

F. O. A.

Cement, mortar and concrete for pouring. A. GUTTMANN. *Beton Eisen* 26, 113(1927).—Studies are given of the effect of water content on the strength, consistency, vol. weight and vol. constancy of portland cement and of mixts. of portland cement and granulated slag.

F. O. A.

The behavior of mortar and concrete at low temperatures. OTTO GRAF. *Beton Eisen* 26, 244-52(1927).—During cold weather care should be taken to use only first class aggregates and to place the material properly. Frost should be allowed to act upon the concrete only after it has reached the strength usually reached in 24 hrs. at 15° to 20°. If the concrete is exposed to freezing when satd. with water its strength should be at least 150 kg./sq. cm.

F. O. A.

The destruction of reinforced concrete structures in a Java harbor. W. LOOS. *Beton Eisen* 26, 89-99(1927).—Numerous examples are given with photographs of reinforced concrete which had been destroyed. The recommendations given are in accordance with the best practice developed recently.

F. O. A.

Protection of concrete against alkali. Further tests by the bureau of public roads on the treatment of concrete with tar and paraffin. E. C. E. LORD. *Public Roads* 8, 105-12, 119(1927); cf. *C. A.* 20, 2056.—Photographs and tables are given.

A. E. GRAY

Effect of calcium chloride and road slab concrete. H. P. OLSON. *Eng. News-Record* 99, 69(1927).—The av. strengths of concrete specimens contg. 0, 1 and 2% CaCl₂ were about equal at 7 days, but those contg. CaCl₂ averaged 700 lbs. less at 28 days than plain concrete cured in a moist closet. Compared with plain concrete

not cured in any way, the strength of concrete contg. CaCl_2 was slightly higher at 7 days but lower at 28 days. Examn. of cores drilled after completion of the work showed a surface-cured concrete had a much higher av. strength and smaller variations in strength than concrete in which CaCl_2 had been incorporated. Brief data on cracking of the finished paving are given.

The economies of concrete mixes for road works. R. T. GILES. *Eng. News-Record* 99, 512-3(1927).—It is concluded: (1) that a 1:2 ratio of cement and fine aggregate gives the best results as regards both economy and wearing surface when using portland cement; (2) that as much coarse aggregate should be used as the voids will permit so long as workability is satisfactory; and (3) that the transverse stress of the slab should be the criterion in preference to the compressive strength of the concrete.

R. E. THOMPSON

Physical chemistry and the road problem. GEORGES BAUME. *Bull. soc. chim. Belg.* 36, 469-84(1927).—A lecture, with special reference to the recent developments in France.

A. L. HENNE

Fire-resistant construction. R. F. STRADLING AND F. L. BRADY. *Dept. Sci. Ind. Research, Brit. Building Research Rept.* No. 8, 57 pp.(1927).—The fire-resistant properties of metals, timber, natural rocks and artificial products are reviewed. Expts. were made to find a fire-resistant mortar and concrete which should be as free from free lime as possible and should also contain no quartz and little calcite. To combine with the lime set free during hydration of portland cement various finely ground pozzolanic materials were added to the cement and it was found that certain clays heated to about 850° and certain slags gave fairly good results. For aggregate well-burned brick is recommended both as sand and as coarse material. A concrete which will regain much of the strength lost during heating on being treated with water is desirable. Coal ashes must be used with caution.

F. O. ANDEREGG

Studies on calcium sulfate. III. New methods for the analysis and use of plaster. I. CHASSEVENT. *Ann. chim.* 7, 43-68(1927); cf. C. A. 21, 3297.—The chem. analysis of the burned plaster gives insufficient information on the proportion of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ and $\alpha\text{-CaSO}_4$ formed above 300° and $\beta\text{-CaSO}_4$ formed below 300° . $\alpha\text{-CaSO}_4$ can be detd. by the calorimetric method: 2-4 g. of the plaster are added to water in a Dewar vessel and agitated; the disengagement of heat observed after 2-3 min. is a measure of the CaSO_4 present. If x is the amount of heat evolved expressed in small calcs. the wt. (p) of the CaSO_4 is given by the formula $p = (x - 20)/20$; 20 is the correction corresponding to the heat of the dissoln. of $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ to satn. If only the proportion of CaSO_4 is to be detd. about 10 g. are used in order to decrease the influence of the correction. The insufficient hardening of plaster is caused by the presence of $\alpha\text{-CaSO}_4$. Two methods were developed to measure the time required for the hardening of plaster, which contains $\alpha\text{-CaSO}_4$. (1) If the plaster does not contain any $\alpha\text{-CaSO}_4$ the elec. resistance of a mixt. with water does not increase during several hrs. (2) CaSO_4 is calcd. from the increase in wt. of the plaster covered with water. Dihydrate modifies the qualities of plaster if present even in very small quantities; it accelerates crystn. The transformation of 1 g. of $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ to $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ liberates 25 calcs. All disengagement of heat observed after the first 3 min. is caused by the crystn. of the dihydrate. Plasters burned at various temps. were examd. and their heat-evolution time curves detd. The d. and resistance against compression of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ were detd. Between d. 1.757 and d. 2.18 the resistance against compression increases rapidly. Alabaster has a d. 2.32 with a corresponding high resistance. Attempts to prep. synthetic alabaster by maintaining a high pressure during the setting of the material failed; the substance obtained was opaque and had a low d. The velocity of crystn. of the dihydrate is very great, therefore the use of mechanical appliances for the mixing of the plaster are not feasible; only above 60° is it slow enough to make the preservation of a CaSO_4 and H_2O mixt. without crystn. for a longer period possible.

J. A. SZILARD

The suitability of gypsum for wall plaster. H. J. SCHWEIM. *Contract Record Eng. Rev.* 41, 565-7(1927).—The properties of gypsum which make it suitable for wall plaster are inherent strength, rapid setting and resistance to fire, heat transfer and sound transmission.

R. E. THOMPSON

Diffusion of water-soluble materials in impregnated woods. R. NOWOTNY. *Z. angew. Chem.* 40, 1060-2(1927).—Sherefesee (U. S. Forest Service Circular 132(1908)) concluded that in ties treated with ZnCl_2 no appreciable diffusion of the impregnant took place after the said treatment ended. By plotting Sherefesee's data graphically the author states that a movement of the ZnCl_2 (by diffusion) to the center is indicated clearly. The value of the Cobra process, i. e., applying the preservative as a paste

to the wood and allowing it to diffuse slowly into the wood, is thereby confirmed.

W. C. EBAUGH

Possible use of shale oil as a wood preservative. A. M. SOWDER. *Ind. Eng. Chem.* 19, 1180-2(1927).—Effects of pyridine and quinoline on *Fomes annosus* show the former to be of little value. The latter compares favorably with other fungicides. Shale oil contg. about 3% quinoline would be effective on wood if injected at the rate of 12 lb. oil per cu. ft. of wood.

BRIAN MEAD

The freeness test in roofing felt manufacture. P. W. CODWISE. *Paper Trade J.* 85, No. 4, 52-4(1927).—A tester which has given satisfactory results in controlling the freeness of roofing stock consists essentially of a vertical glass tube about 1 7/8 in. internal diam. and over 25 in. long, fitted at the bottom with a 50-mesh wire-cloth screen and with marks indicating vols. of 200 cc. and 1050 cc., measured from the bottom. Means are provided for sealing the bottom of the tube and subsequently releasing the same to give an unobstructed flow through the wire screen. The detn. is carried out by filling to exactly the 1050-mark with stock at 80° F contg. exactly 1 g. of fiber in 300 cc., releasing the sealing device at the bottom of the tube, and noting the time (in sec.) required for the level of the liquid to fall to the 200-mark. Duplicate results (within 1-2 sec.) are readily obtained. Representative examples are given of the type of results obtained with different kinds and wts. of felts. The application of the test to mill control is briefly discussed.

A. PAPINEAU-COUTURE

The utilization of bituminous rock (LANDGRAEBER) 22. Testing of road oils (SCHAFER) 22. Bituminous emulsion for use on roads (U. S. pat. 1,643,675) 22. Bituminous composition for paving, roofing or other purposes (U. S. pat. 1,643,520) 22. Bituminous composition containing rubber (Brit. pat. 263,028) 30.

Cement. S. L. A. ODÉN. Swed. 62,701, March 29, 1927. The ground cement is sepd. into several groups of different grain sizes, each of the resulting products, alone or in mixts. of two or more such groups, forming cements with other hydraulic properties.

Cement. M. LANTZ. Swed. 63,382, July 19, 1927. After the clinker has been ground with addn. of a suitable amt. of gypsum, the ground mixt. is for a second time passed through a grinding mill where an extra quantity of gypsum is added and is ground and mixed intimately with the cement.

Waterproof cement. H. V. WELCH. U. S. 1,644,964, Oct. 11. Portland cement is mixed with 5-10% of diatomaceous earth together with hydrocarbon material naturally occurring with the diatomaceous earth. U. S. 1,644,965 specifies similar mixts which may contain oil-bearing shale.

Molding articles from magnesia cement. AKTIEBOLAGET MARINBETONG. Swed. 61,693, Oct. 12, 1926. The molding is carried out in an inwardly polished mold prepd by electrolytic pptn. with a thickness of about 2 mm. After hardening the article is made to slip by subjecting the mold to a sudden violent heating of short duration, the article itself remaining cold.

Slag cement. I. G. FARBERIND. A.-G. Brit. 263,124, Dec. 15, 1925. Slag obtained from the fusion of phosphate, sand and C with elimination of P or its oxides is converted into cement by addn. of calcareous, aluminous or like materials after it has left the furnace and while it is still molten.

Fireproof mortar. R. L. TAYLOR. U. S. 1,645,030, Oct. 11. A mortar suitable for use in hard finish plastering comprises the residue obtained by burning coal mine slate and waste (commonly called "red dog"), ferro-Mn slag and a binder such as cement.

Multi-ply felt roofing material saturated with bituminous composition. L. KIRSCH BRAUN. U. S. 1,644,652, Oct. 4.

Fire-resistant fibrous material. ALEX. WINOGRADOFF. U. S. 1,645,172, Oct. 11. Combustible fibrous material such as wood is treated with a mixt. of a soln. of MgSO₄ or other H₂O-sol. Mg salt and a soln. of a H₂O-sol. bicarbonate such as KHCO₃ and the material is subsequently heated to ppt. MgCO₃ in the fibers. U. S. 1,645,173 relates to similar solns. for the same purpose.

Wood preservative. STOCKHOLMS SUPERFOSFAT FABRIKS A.-B. Swed. 62,685, March 29, 1927. The active preserving component consists of a mixt. of one or more sol. F salts, phenols or phenol ethers and neutral water-sol. salts of sulfonated phenols or phenol ethers. By regulating the ratio between the salts of sulfonated phenols and the unsubstituted phenols a suitable soly. of the preservative can be attained.

Wood preservative. K. H. WOLMAN. Can. 273,656, Sept. 6, 1927. A wood preservative, which is stable with respect to Fe, consists of mixts. of NaF and Na₂SiF₆.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

American fuel resources. O. P. HOOD. *Mech. Eng.* 49, 1061-2(1927). E. J. C.

Notes on recent developments in fuel technology. R. WIGGINTON. *Fuel in Science and Practice* 6, 289-92, 337-9(1927); cf. *C. A.* 21, 1174.—Short reviews upon the following subjects: the K. S. G. low-temperature carbonization process, coal carbonization, ovens for gas manufacturing, coke cooling, a steam pressure transformer, petroleum refining, the "Eddystone" app. for boiler flues, the Benson boiler, flame temps., ploughing with producer gas.

D. A. REYNOLDS

Minimum or maximum heating value (of fuel)? A. D. HUDLER. *Gas u. Wasser-fach* 70, 917-9(1927).—A plea for the use of heating values of fuel corrected for the effect of any moisture ("minimum heating value") when computing efficiencies as in gas producers.

R. W. RYAN

The retention of certain hydrocarbons by solid fuels. B. MOORE AND F. S. SIN-NATT. *Fuel in Science and Practice* 6, 312-8(1927).—Tests designed to det. the absorption of benzene, toluene and xylene by bituminous coal, anthracite, Irish peat, gas coke, animal charcoal and wood charcoal were made as follows: Three g. samples of 200 mesh material were air dried 1 hr., at 105°, cooled in H₂SO₄ desiccators, weighed and permitted to stand in H₂SO₄ desiccators contg. the hydrocarbons in shallow dishes at 16° for definite time intervals and re-weighed. Retention of hydrocarbons was then detd. by weighing the samples after standing in air, corrections being made for changes in humidity. Peat and coke absorb much smaller quantities of hydrocarbons than the other fuels tested. The rate of loss of absorbed hydrocarbons is rapid during the first 40 hrs., then decreases more slowly until after 480 hrs. the loss is very slow. The amt. of vapor retained after 480 hrs. is proportional to the time of exposure to the vapor. Absorbed hydrocarbons raised slightly the glow-point of coal, this effect increasing with the amt. of absorption.

D. A. REYNOLDS

Motor alcohol and the hygroscopicity of the air. K. PETRIK. *Z. Spiritusind.* 50, 136-7(1927).—In the motor fuel tested which consisted of a mixt. of 50% alc. of 96.5% purity, the remainder being benzene and benzine, the water in the alc. burned consisted of 15.4% of the amt. contained in the 1023 cu. m. fairly dry air necessary to effect combustion of 1 kg. of motor fuel. The necessity of using dehydrated alc. has not been clearly demonstrated.

C. N. FREY

Factors governing the purchase of coal. M. B. SMITH. *Mech. Eng.* 49, 1063-6(1927).

E. J. C.

Our (British) available coal supplies and their utilization. C. H. LANDER. *Gas J.* 179, 547-8; *Gas World* 87, 230-1; *Chemistry & Industry* 46, 843-5; *Engineering* 124, 340-1(1927).—Coal remaining in Great Britain has been estd. at 180,000 million tons, annual production, approx. 260,000,000 tons, of which some 80,000,000 tons are exported. Data on coal consumed by different industries in Great Britain during 1924 and 1925 are tabulated. Losses caused by present methods of utilization and possible improvements are discussed. Brief reviews are given of some investigations on smoke abatement, low-temp. carbonization, hydrogenation of coal, and the constitution of coal. The importance of coördinating lab. results with full unit scale expts. before passing processes to the industries is emphasized and the objectives of the Fuels Research Board are outlined.

W. W. HODGE

The utilization of our (British) coal supplies. J. W. COBB. *Gas J.* 179, 548-50; *Gas World* 87, 231-3; *Chemistry & Industry* 46, 845-8; *Engineering* 124, 341-2(1927).—The relative advantages and disadvantages of hydrogenation, gasification with steam or air, carbonization of coal and of refractory and metal retorts are outlined. The outstanding technical factor limiting the economies of carbonization seems to be that of speed of operation. Progress may be made by altering the mech. and thermal treatment of the coal and by modifying its chem. behavior and reactivity. Results of gasification expts. with cokes made from coal alone and from coal mixed with 5% of Fe₂O₃, CaO or Na₂CO₃ are tabulated and discussed. The gas yield increased 20% with a Na₂CO₃ coke and NH₃ yield, by 35% with a CaCO₃ coke. On treating with steam 10 g. samples of the different cokes heated in tubes to 1000° the comparative rates of coke gasification were: pure coke 1.15, CaO coke 5.2, Fe₂O₃ coke 10.5 and still faster for the soda coke. Rate of gasification with steam of pure coke at 800° was 0.9 with 18.0% CO₂ in the resulting gas, of soda coke the rate was 5.8 with only 1.7% CO₂ in gas produced. Cokes made with alumina and silica addns. behaved exactly like the pure coke. In expts. passing CO₂ at such a rate over the cokes at 1000° that the pure coke

gave a gas with only 47.8% CO, the Fe oxide, lime and soda cokes produced gases with 93, 95 and 97% CO content, resp.; at 900° the CO percentages were: pure coke 14%, the others in order, 70, 63 and 82%. Expts. with addns. of less than 5% of the inorg. compds. show that useful effects can be obtained thereby in a more than proportionate measure. W. W. HODGE

Cebu coals. L. A. FAUSTINO. *Philippine J. Sci.* 33, 375-9 (1927).—Eight samples from the Licos mines averaged about 10% moisture, 4.0 volatile combustible matter, 44.0 fixed C, 0.41 S and, excluding one sample, 4.5 ash. Cal., excluding the same sample as before, ranged from 6251 to 6982. Of the 7 samples from Uling mines, 5 were generally higher in moisture and ash and lower in cal. than the samples from the Licos mines. Of the 15 samples only 2 were coking coals. Contrary to expectations the quality of the coal does not improve with the depth of mining. L. W. RIGGS

The chemistry of coal. R. V. WHEELER. *Gas J.* 179, 624-7; *Gas World* 87, 233-5; *Chemistry & Industry* 46, 848-54; *Engineering* 124, 344-6 (1927); cf. *C. A.* 20, 3554; 21, 2780.—Researches on phys. structure and chem. compn. and constitution of coal are reviewed under the subdivisions: coal-forming materials; major constituents of coal; chemistry of coal ulmins, spore exines and cuticles, resins, hydrocarbons; extn. of coal by solvents: distn. of coal, effects on ulmins and on the resistant plant remains; oxidation of coal. The relation of these factors to coal formation, banded constituents, geological age, coking properties and the manuf. of oils from coal are discussed. W. W. HODGE

Colloidal chemistry of coal and related problems. H. WINTER. *Kolloid-Z.* 42, 233-42 (1927).—The formation of coal from vegetation is treated as a dehydration problem involving a change from a hydrosol to a hydrogel, finally giving an insol. gel. The nature of various samples of coal can be studied with the microscope and some photomicrographs are presented with the discussion. The macroscopic examn. of coal is described and its value is also stressed. R. H. LAMBERT

The cleaning of coal. XVI. XVII. W. R. CHAPMAN AND R. A. MOTT. *Fuel in Science and Practice* 6, 293-311, 340-58 (1927); cf. *C. A.* 21, 1175, 3262.—Froth flotation and dewatering of washed coal are discussed in detail from the theoretical as well as practical point of view. Numerous illustrations are included. D. A. R.

Separation of coals according to specific gravity. MANFRED DUNKEIL. *Mitt. Schlesischen Kohlenforsch. Kaiser-Wilhelm. Ges.* 2, 183-92 (1925); *Chem. Zentr.* 1926, II, 1707.—Instead of concd. aq. salt solns., D. utilizes in the floating method a mixt. of CCl₄ and xylene, and thus obtains fractions of different ds. which behave quite differently on coking. Anthracite and dull coal do not, however, remain within single fractions, but distributed throughout the fractions of different ds. The results show that 2 coals may be widely different even when they appear to be the same by proximate analysis. C. C. DAVIS

Low-temperature distillation of long-flame coal agglomerated by a pitch or coal oil. ANDRÉ LÉAUTÉ. *Compt. rend.* 185, 465-7 (1927).—By the use of a binder it is possible to avoid swelling and solidification of long-flame coal on distn. without the addn. of non-bituminous coal or without operating with carefully controlled heating. When anthracene oil is used as the binder a solid residue is obtained similar to anthracite and can be used as such. This method offers a means whereby a quantity of oil is obtained which is approx. equal to the amt. of binder used and a quantity of gas varying from 2 to 15% is obtained depending on the rate of distn. D. H. POWERS

New methods of coal distillation and gasification. DRAWE. *Braunkohle* 26, 573-7; *Erdöl u. Teer* 3, 614-8 (1927).—A general discussion. F. S. GRANGER

The recovery of by-products from the distillation of coal in modern coke ovens, with special reference to the still process. R. GUNDERSON. *Ind. Chemist* 3, 397-402 (1927).—The "direct" process is briefly outlined, and the "still" or "semi-direct" process is described in detail with illustrations. E. G. R. ARDAGH

The refining of brown coal gas (Schwelgas) benzine. H. TRUTNOVSKY. *Teer* 25, 363-6, 379-82 (1927).—A discussion of the effects of various standard refining methods applied to this rather difficult raw material to make it a satisfactory motor fuel, which has been accomplished commercially. The principal objectionable qualities, namely odor, resin and C formation in the engine, color and changes in storage, are due mainly to the highly unsatd. constituents (diolefins, etc.) which also include a large portion of the S compds. present. The methods are discussed under 4 headings. (1) With *sulfuric acid* the S content can not be reduced very far without excessive loss. The common com. practice is to treat with H₂SO₄, followed by lye, and distil twice. Addn. of a little paraldehyde, with the acid, removes more S and greatly improves the odor. (2) The diolefins, etc., including S compds., may be removed by polym-

erization followed by distn. This may be accomplished, with little loss, either by heating with fuller's earth, at 100°, or alone under 13.5 atm. pressure at 230°. (3) Washing with hypochlorite soln., followed by lye, removes only a small portion of the S, while relatively large quantities of Cl are taken up by the oil. The Cl and considerable S are removed in the subsequent fractionation, giving a high-grade product. The removal of S by this means depends largely on the form of the S. The S compds. remaining after refining with H₂SO₄ are so altered that a larger proportion may be removed by subsequent application of the hypochlorite method than with the raw material. (4) *Silica gel*, although effective with other materials in this respect and with this material in other respects, does not remove much of the S unless used in prohibitive quantities, and then a large portion of the benzine is absorbed which, on recovery, is inferior to the refined product. Owing to the removal of the diolefins, etc., by polymerization, however, the main product is highly satisfactory except for the S content. Contrary to earlier claims, no method has been found which will remove all of the S, but it has been found more practical to judge this product by actual performance in the engine rather than by chem. analysis. F. S. GRANGER

Technical and economic considerations on coal refining with special reference to high-pressure processes. C. KRAUCH. *Erdöl u. Teer* 3, 455-7 (1927).—A general discussion. F. S. GRANGER

The refining of coal and its liquefaction. A. SPILKER. *Braunkohle* 26, 545-53 (1927).—A general discussion. F. S. GRANGER

The chemical principles in coal liquefaction. FRIEDRICH BERGIUS. *Svensk Kem. Tids* 39, 189-208 (1927).—An address on coal chemistry in German. A. R. ROSE

Utilization by processing of low-grade coals as well as liquefaction of coals. ALOIS CZERNIAK. *Montan. Rundschau* 19, 283-90, 309-16, 337-44, 371-5 (1927).—An outline of the chem. properties of C and several series of hydrocarbons is followed by a discussion of the methods for utilizing brown coals, lump coal and lignites. Effects upon the coal, its by-products and heating values are given of: improvements in by-product oven design; drying of the coals by applying steam under pressure; the "Berfinierung" process; the carburization or "Delkeskamp" method; and the swelling processes. Descriptions of these processes, sectional diagrams of a Rolle-Oven installation and several tables of data obtained using different kinds of coals, also manuf. and uses of producer gas and "grudekok" are included. The distribution and economics of the petroleum industries are discussed from the national and world standpoints. The expts. of Bergius and of Fischer in making liquid fuels from coal are reviewed, compared and the importance of these processes to countries which do not possess petroleum fields is emphasized. A no. of references to recent articles on liquefaction are given. W. W. HODGE

Drying brown coal. HANS FLEISSNER. *Arch. Wärmewirt.* 8, 185-6; *Montan. Rundschau* 19, 317-20, 345-8, 377-82 (1927).—The coal is placed in a pressure tank and steam at 4-8 atm. admitted. When the charge has been thoroughly warmed, the steam is discharged (into another drum), and air is blown through. The dried coal does not crumble, is not hygroscopic, and does not tend to ignite. E. W. T.

The hydrogenation of brown coal with hydrogen in the presence of aqueous bicarbonate solutions. FRANZ FISCHER AND ALBERT JÄGER. *Abhandl. Kenntnis Kohle* 7, 141-3 (1925); *Chem. Zentr.* 1926, II, 1915.—The use of aq. NaHCO₃ in the presence of H under pressure for the hydrogenation of coal is undoubtedly superior to HCO₂Na or to CO + H₂O, even though these latter have already attained success. C. C. DAVIS

Studies in carbonization. I. Influence of size of coal. ARTHUR SMITHELLS, A. PARKER, H. KERR AND A. C. MONKHOUSE, et al. *Inst. Gas Eng.* 16th Rept., 162-229 (1926).—A discussion of the many factors involved in coal carbonization and of requirements for a lab. app. suitable for the study of these factors is followed by a complete description including elevation diagrams and detail drawings of the exptl. plant used. A cronite (Ni-Cr-Fe-W) retort capable of handling 30 lb. charges of coal was placed in a fire brick furnace setting. A Nottinghamshire moderate caking coal was used after sizing into 6 grades: 1 1/4 to 3/4 in., 3/4 to 1/2 in., 1/2 to 1/4 in., 1/4 in. to 10 mesh, 10 to 30 mesh, and all through 30 mesh. The volatile matter was led through a series of scrubbers and meters to a gas holder. Details of operation of plant, methods of sampling and analysis of the coal, cokes, liquors, tars, pitch, crude and purified gas, and of measurement of temps. and pressures are given. Six preliminary tests were run to develop proper working conditions. Results are summarized in 5 sets of graphs and 21 tables including calcd. wt., heat, and C balances for 8 complete tests. Coking time was 2 3/4 hrs. for 5 and 2 hrs. for 3 of the tests. Temps. of the retort

ranged from about 940° to 1000°. The method (C. A. 19, 3011) for prepg. sections of coke by filling the open pores with plaster of Paris and magnesia, polishing and taking photographs is fully outlined and 43 photographs are given of sections of by-products and beehive cokes, of cokes formed in the 8 tests reported and of cokes made by carbonizing coals mixed with 5% of CaO, Fe₂O₃ or Na₂O. The cronite retort after having been heated to about 1000° for a total of over 2000 hrs. did not show any signs of deterioration. The supply of heat to the retort setting was the same in all 8 tests. Gas made in therms (gross) per ton coal rose from 72.3 with grade 1 1/4 to 3/4 in. to 75.8 therms with grade 10 to 30 mesh. This increase in total thermal values of gas made with decreasing the size of coal particles appears to be due largely to an increase in the amt. of secondary decompn. of tar, there being a gradual reduction in tar yield from 8.3 to 6.2 gals. per ton coal. In the early stages of carbonization the rates of gas production were greater with the larger sizes of coal than with the smaller sizes, but after 1 hr. the rate of gas production became greater with the smaller sizes and at the end of the 2 3/4 hr. period the total vols of gas evolved from the smaller grades of coal were greater than those from the larger grades. Raising the temp. of the retort from 977° to 1000° produced in the early stages of carbonization a great increase in the rate of gas evolution and showed the importance of accurate temp. control. Macro- and micro-studies of the coke sections polished in plaster showed the coke produced from the 10-30 mesh coal was more uniform in structure than the cokes from the larger sizes and that the walls of the larger cells contained a greater no. of very small pores. Discussions of the report by members of the society are appended.

W. W. HODGE

The economics of coal carbonization in the United States. GEO. A. ORRICK. *Mech. Eng.* 49, 1055-60 (1927).

E. J. C.

Low-temperature carbonization of coal. KARL D'HUART. *Chaleur et industrie* 8, 512-4 (1927).—Brief description of the K. S. G. Stinnes process, which has been in com. operation for a no. of yrs. at the Mathias Stinnes mines, Kariap (Essen).

A. PAPINEAU-COUTURE

Experiments on the valuation of coal dust. FRANZ FISCHER and WALTER KRONIG. *Abhandl. Kenntnis Kohle* 7, 156-63 (1925); *Chem. Zentr.* 1926, II, 1483.—The expts do not lead to a satisfactory method for the valuation of coal dust, but show rather that a method of valuation can be developed only by a scheme of expts. which are as closely related as possible to large-scale conditions.

C. C. DAVIS

The expedient utilization of the tarry constituents of the coal set free in the complete gasification of coal in the coal-water-gas producer. GWOSDZ. *Erdöl u. Teer* 3, 503-5, 518-21 (1927).—A general discussion of existing processes.

F. S. GRANGER

Burning Mid-Western coals. E. L. McDONALD. *Mech. Eng.* 49, 1082-4 (1927).—A discussion of steam coals mined in Iowa, Missouri, Kansas, Arkansas, Oklahoma and Illinois. Characteristics of the coal fields and the methods of mining are touched upon and analyses of the coals from these fields are tabulated. Results of the use of Mid-Western coals in a forced-draft chain-grate stoker unit at the Northeast station of the Kansas City Power & Light Co., Kansas City, Mo. are given. The chain-grate stoker permits control of the air supplied to any portion of the fuel bed and this is advantageous as well where the fusion temp. of the ash is so low (980-1205°). Characteristics of buffing, and slagging tendencies are discussed. The use of preheated air is desirable, as is shown by a curve. A comparison of efficiencies of boiler burning 5 Mid-West coals is charted. Any of the coals from these fields may be burned, if properly handled in the proper equipment.

W. H. BOYNTON

The Lancashire coalfield, the Ravine seam. II. Carbonization in continuous vertical retorts. R. T. THRELFALL, et al. *Dept. Sci. Ind. Research, Brit. Repts., Fuel Research No. 9*, 33 pp. (1927).—Large-scale tests were made in continuous vertical retorts with Ravine seam bituminous coal to det. its suitability for gas manuf. using coal alone, coal plus 5% steam, and with 20% steam. Complete data are presented as to the source of coal, characteristics of the seam, phys. and chem. properties of the coal, ash, gas, NH₃ liquor, tar and coke used and produced in the tests. Work wt. balances of materials entering and leaving the system show losses of 3.60% using 5% steam (some leakage through retort walls in this test) and 3.49% with 20% steam. The general effects of using 20% steam as compared with 5% steam were: increases of 37.5% in cu. ft. gas, 23.4% in therms, 1.1% of tar, and 25.5% in (NH₄)₂SO₄ yield per ton coal; and a decrease of 10.2% in B. t. u. per cu. ft. gas. Similar data are tabulated for this and other coals when carbonized alone and when using 20% steam. Thermal balances for the tests, a section drawing of the Ravine seam, and elevation and section diagrams of the continuous high-temp. retort installation at H. M. Fuel Research

Station are given. Coal from the Ravine seam proved to be well suited for gas making. Additional expts. showed: this coal and the coke produced in the gas manuf. tests could be burned efficiently for generating steam, but the low m. p. ash was a disadvantage; the coke made a satisfactory producer gas fuel, but attacked the furnace lining considerably; excessive clinker formation resulted when this coke was used for suction-gas production. W. W. HODGE

The recovery of ammonia and sulfur from coal gas by the Burkheiser process. W. BURKHEISER. *Gas u. Wasserfach* 70, 943-5(1927); cf. *C. A.* 21, 1880.—The direct union of SO_2 and NH_3 to form $(\text{NH}_4)_2\text{SO}_4$ is discussed. Complete freedom from H_2S is required in the gas; this can be best accomplished by liquid purification methods. $(\text{NH}_4)_2\text{SO}_4$ is oxidized to $(\text{NH}_4)_2\text{SO}_4$ almost quantitatively on standing in the air for a period of 2 days (in favorable cases) or sometimes as long as 6 weeks. No loss of NH_3 was observed in the latter period. R. W. RYAN

Light oils from Utah coal. R. L. BROWN AND R. B. COOPER. *Power Plant Eng.* 31, 1044(1927).—Mesa Verde coal was heated to a max. of 725° by means of superheated steam. A yield of 7 cc. per kg. of coal was obtained consisting of 30% amylenes, 10% pentane, 26% oil made up of a 6 C-atom compd., 17% oil made up of a 7 C-atom compd., 8% oil of an 8 C-atom compd., and 9% oil boiling from 125 to 200° .

The decomposition of vegetable matter under soils containing calcium and sodium as replaceable bases. E. MCKENZIE TAYLOR. *Fuel in Science Practice* 6, 359-67 (1927).—Various constituents of peat undergo bacterial decompn. under alk. anaerobic conditions produced by a superimposed layer contg. sodium-alumino-silicic complex. Sugar and starch form entirely gaseous products. Cellulose may form humic substances, sol. in the alkali present and which are later completely decompd. Under these same conditions beech leaves decomp. yielding a substance closely resembling fusain in structure and compn. Conclusion: The occurrence of natural fusain in peat under an alk. roof is best explained by the decompn. of ligneous materials under alk. anaerobic conditions provided by the hydrolyzing of the roof complex. D. A. REYNOLDS

Determination and guarantee of heating value. L. NIEDERSTRASSER. *Arch. Warmewirt.* 8, 171-4(1927).—A discussion of the effect of various errors in coal sampling and calorimetry, and of the means of securing agreement between buyer and seller.

Testing of furnaces with recorders and photography. KARL BOLLINGER. *Arch. Warmewirt.* 8, 143-4(1927).—Good firing produces a bright flame, so in the app. described a piece of sensitive paper passes slowly by a slit illuminated by the flame, and is afterward developed. ERNEST W. THIELE

Energy consumption of powdered coal mills. P. ROSIN AND E. SCHULZ. *Arch. Warmewirt.* 8, 69-73, 109-15(1927).—The effect of moisture in the feed, rate of feed, and fineness of grinding on the energy consumption of a ring-roller mill with air sepn. was studied. The energy consumed per kg. of product, over that required at no load, is a const. for a given fineness and moisture content, but the fineness tends to decrease at light loads. ERNEST W. THIELE

Energy consumption of powdered coal mills. P. ROSIN AND E. RAMMLER. *Arch. Warmewirt.* 8, 239-43(1927); cf. preceding abstr.—A Fuller mill was studied. The advantages of full load were greater than with the ring-roller mill, but the fineness did not fall off with decreasing load. ERNEST W. THIELE

The calculation of powdered coal furnaces. WILHELM GUMZ. *Feuerungstech.* 15, 157-60, 172-4, 184-6, 197-9(1927).—A full discussion, deriving several formulas and applying them to a particular example. ERNEST W. THIELE

Furnace for heating shapes with powdered coal. A. FARNER. *Arch. Warmewirt.* 8, 94-5(1927).—An Italian furnace 10.5 m. long, heated with 4 burners, is described. ERNEST W. THIELE

Efficiency of furnaces, especially for powdered coal. A. B. HELBIG. *Feuerungstech.* 15, 193-7(1927).—Since the dry ash-free coal substance is nearly const. in compn. for a given type, H. proposes to prep. tables of heat content of flue gases, etc., based on 1 kg. of pure coal, to facilitate the prepn. of heat balances. E. W. T.

Coal drying for powdered coal furnaces. H. BLEIBTREU. *Arch. Warmewirt.* 8, 81-7(1927).—A mathematical discussion of the various types of driers. E. W. T.

Pulverized coal installation saves \$6300 in six months. B. H. ROBERTS. *Power* 66, 540-1(1927).—Unit pulverizers replaced oil firing. The efficiency of the boiler plant was 75%. D. B. DILL

Economy of lignite-dust firing. P. ROSIN. *Braunkohle* 26, 364-89(1927).—An

elaborate general statistical discussion from the engineering and economic standpoint.

F. S. GRANGER

Recent investigations of the mechanism of ignition and combustion in Diesel engines. FR. SASS. *Z. Ver. deut. Ing.* 71, 1287-92(1917).—A review of the literature of the past few years.

GEORGE CALINGAERT

The significance of lignite benzene for internal-combustion engines and its relation to the lubricating oils. FR. FRANK. *Braunkohle* 26, 553-8(1927).—Until recently lignite benzene has been in disfavor as an automotive fuel because of its odor, unsatisfactory performance and impurity causing carbonization and sticking of valves. A greatly improved product, however, is now being produced as shown by practical running tests and chem. investigation. The new material evaps. completely in 24 hrs. by the Dietrich method, leaving no resin and is rich in aromatics, resulting in high anti-knock value even when mixed with inferior gasoline, as shown by practical tests. The results in regard to carbonization, etc., it is to be inferred from the exhibition of engine parts and photographs, were highly encouraging, although details are lacking in the text. Mention is made of a refining method being developed by F. involving the sepn. of the aromatic and paraffin constituents by selective soln. in hydroxyl compds. A partial sepn. of the S compds. seems also to have been effected.

F. S. G.

Smoke abatement methods used in Cleveland. E. H. WHITLOCK. *Mech. Eng.* 49, 1071-5(1927).—The importance of clear definition in municipal ordinances on smoke abatement is noted. Correct design of combustion equipment, the use of accurate control instruments, and the importance of education are pointed out. Recently a "soot-fall test" has been established which permits detn. of the total deposit at various stations throughout the city, and analysis is made of the deposit for: ether ext., fixed C, ash, and Fe_2O_3 . Railroads and marine shipping interests are cooperating.

W. H. BOYNTON

Production and purification of benzene by means of silica gel and other adsorptive substances. A. THAU. *Glückauf* 62, 1049-56; *Chem. Zentr.* 1926, II, 1914.—After mentioning the disadvantages of the Brunck process for adsorbing heavy hydrocarbons such as C_6H_6 from coal gases by tar wash oil, and after then discussing the difficulties of the Bunte activated C process, the SiO_2 -gel process is discussed and the plant of the "Silica Gel Corp." of Baltimore for the adsorption and purification of C_6H_6 , the quality of the products obtained and the economy are described in detail and criticized. The establishment of plants in Germany for the SiO_2 gel process is also discussed (cf. Koetschau, *C. A.* 20, 1476).

C. C. DAVIS

Production of benzene through distillation in vacuo. R. KATTWINKEL. *Glückauf* 62, 529-34; *Chem. Zentr.* 1926, II, 303.—The expts. of Bahr and Rühl (*C. A.* 19, 3581) are criticized, particularly the use of unsuitable wash oil. From expts. of his own, K. concludes that the vacuum distn. process of Raschig possesses fundamental advantages over the older steam distn. process. It furnishes a highly valuable product free of wash oil and it requires only 0.5 as much steam and fresh oil as the old process.

C. C. DAVIS

The ideal efficiency of internal-combustion engines. W. T. DAVID. *Gas J.* 179, 695-6(1927).—Sp. heat and dissocn. values ordinarily used in calcg. the ideal possible efficiencies of internal-combustion engines are too high and consequently ideal efficiencies are too low. Expts. have been made with pure gases (mainly CO and H_2 mixts.) by optical indicating and flame photography. On explosion, chem. equil. is far from being attained at max. pressure, contrary to the usual assumption of complete combustion used in calcg. sp. heats.

R. W. RYAN

The economics of scientific control in the production of town's gas. E. W. SMITH. *Gas J.* 179, 616-8(1927).—Some applications of science to the gas industry are given and a plea is made for more financial support for research and for a more scientific attitude of mind towards all gas works problems.

R. W. RYAN

The new gas works at Stettin. SPOHN. *Gas u. Wasserfach* 70, 893-8, 925-6(1927).—A detailed description is given of the new "Stettin" vertical oven plant. A feature of this plant is the absence of belts and conveyors and the compact arrangement.

R. W. RYAN

Gas blending. ROBERT STURROCK. *Gas J.* 179, 621-4; *Gas World* 87, 256-60(1927).—Blue gas from "Simplex" water gas plant is used to reduce gas from horizontal retorts to 439 B. t. u. per cu. ft. On the Simplex plant a 6 min. blow and 20 min. run period are used, which decrease labor charges. Analyses are given for the blue gas at various run times.

R. W. RYAN

The economic and technical significance of fuel waste gas quantities. BR. SCHULZ. *Brennstoff u. Warmewirtschaft* 9, 377-80(1927).—A discussion.

F. S. GRANGER

Sealing fluids for technical gas investigations. OTTO WOLF AND KRAUSE. *Arch. Wärmewirt.* 8, 216-8(1927).—The soly. of CO_2 at 20° in water and NaCl and CaCl_2 brine was tested with a Bunte buret. Acidulation with H_2SO_4 or HCl is useless or harmful, except for alk. water. Nearly satd. NaCl brine is recommended; it reduces the soly. to 30% of that in pure water.

Automatic gas analysis by physical means. OTTO DOMMER. *Arch. Wärmewirt.* 8, 92-3(1927).—Two streams, one of flue gas and one of air, are drawn by the same aspirator through a capillary tube and an orifice in series. The difference in pressure drop through the 2 capillaries (arising from the difference in gas viscosities) is measured by a U-gage and is proportional to the CO_2 content of the flue gas. With a CuO furnace, CO also can be detd.

Testers and counters for flue gas. WERNER AHRENS. *Arch. Wärmewirt.* 8, 183-5(1927).—An integrator for a CO_2 or CO recorder is formed by causing the indicating current to decompose water in a simple rugged cell. The H_2 evolved is collected and read off.

Removal of carbon monoxide from illuminating gas by means of ammoniacal cuprous chloride solution. W. GLUUD AND G. SCHNEIDER. *Ber. ges. Kohlentech.* 2, 51-3; *Chem. Zentr.* 1926, II, 2516-7; cf. *C. A.* 21, 4053.—The soln. consisted of 213 g. of NH_4Cl , 172 g. CuCl and 360 cc. of concd. NH_4OH (19.4% NH_3) according to Wollers. The gas contained 2.4% CO_2 , 2.0% C_mH_n , 1.6% O and 9.8% CO . The expt. was carried out at 15° . According to the Hempel procedure, with absorption of 6 vols. the soln. (2.7 l.) was exhausted after 165 l. had been passed through it. Actually, however, it sufficed for about 400 l. of gas passed through at the rate of 800 l. per hr. at 60 atm. pressure. The issuing gas then contained about 0.6% CO . The absorption soln. deposited metallic Cu . Hot 20% NaOH absorbed 280 l. of CO , the CuCl soln. only 30-40 l. of CO per 2.7 l. of soln.

A new method of titrating naphthalene in gases. J. BONTE. *Bull. soc. chim. Belg.* 36, 485-90(1927).—The principle of the method is to cool the gases down to 0° . At this temp. the vapor tension of the naphthalene is practically naught. The naphthalene is collected on a wool glass filter, then dissolved in a known amt. of glacial AcOH . H_2O is added from a buret, and the reading is made when the naphthalene comes out of soln. By means of a curve previously drawn, the amt. of naphthalene can be deduced from the quantity of water added, and is converted in g. of naphthalene per cu. m. of gas.

A by-product producer gas plant at a copper works. ANON. *Engineer* 144, 234-5(1927).—This plant, at an isolated mine in Northern Rhodesia, meets the following requirements: power for driving machinery; heat for reduction and treatment of ores; NH_3 for leaching out CuO from the ores; tar of a quality suitable for readily reducing the oxide in the smelting furnaces, for painting and for road-making purposes. The arrangement of the plant is described and illustrated.

Modern gas producers. F. RICOLFI. *Met. italiana* 18, 197-204(1926).—A description, with sketches and photographs of 2 types of gas producers, (1) the coke gas producer with automatic scorification, (2) the gas producer on the Tully system.

Rational systems of combustion. F. RICOLFI. *Met. italiana* 18, 113-21(1926).—Description of a modern automatic system of combustion. Phot. graphs and sketches are given.

Luminous and non-luminous flames in industrial gas furnaces. KARL HUFFELMANN. *Feuerungstech.* 15, 145-6, 160-3, 174-6, 186-7(1927).—H. gives an elaborate calcn. of the heat transfer in an open-hearth furnace, assuming various flame lengths, degrees of luminosity, types of fuel, and degrees of preheating.

Physics of the oxide radiator—especially the Welsbach mantle. H. EWEST. *Gas u. Wasserfach* 70, 873-7(1927).—The phys. theory underlying the oxide radiator is reviewed. The spectral distribution of the radiation from the Welsbach mantle and of mixts. of ThO with La , Ni , Er , Pr and Nd oxides is shown graphically for various temps.

A tar obtained from lignite by steam distillation. I. Comparative experiments on the distillation of lignite by external and internal (superheated steam) heating. W. FISCHER. *Braunkohle* 26, 246-51(1927).—The lab. app., in which the lignite was distd. with superheated steam, is described. The duration of the distn. was 18 hrs. By this means complete removal of the tar can be accomplished with very little decompn. of original bitumen, and the liberation of 54.8 l. of gas, per kg. of dry coal, as against 108 l. by external heating. In the steam distn. the gas evolution rate began to increase rapidly at 400° , reaching a max. at about 436° (when no more tar

came over) and then falling off rapidly to the end of the distn. at 460°. The coal yielded 32% dry distillate and 47% coke, with steam, against 25 and 50% by external heating. The steam coke yielded 49.4 l. of gas per kg. on heating at red heat, whereas the other yielded only 24 l. The steam tar contained higher-boiling acid and neutral constituents and neutral oil of higher sp. gr. and S content. F. S. G.

Viscosity of tar. J. LAGERQVIST. *Svensk Kem. Tids.* 39, 97-100(1927); cf. C. A. 21, 2551.—The Engler unit of viscosity (E) is 26 times that obtained by the Lunge-Berl method. Viscosity may be detd. as the time (t) in seconds for a given vol. of the sample (200 cc.) to flow through a tube of a given bore (6 mm.). For 3 of the latter procedures the values are translated to Engler units as follows: $E = 0.442(t_4 - 5)$ and $E = 0.216(t_5 - 5)$ for 200 cc. and 5- and 6-mm. tubes, resp. When the vol. is taken as 100 cc. (6 mm.) the following holds for all samples with E in excess of 180, $t_{200}/t_{100} = 2.35$ and $E = 1.0157t_{100} - 2/(1 - 0.0000038t_{100})$. A. R. ROSE

Variation of the Hutchinson consistency of tars with temperature. H. M. SPIERS. *J. Soc. Chem. Ind.* 46, 329-30T(1927); cf. C. A. 21, 485.—Contrary to Mallison and Soltau (*Brennstoff-Chem.* 8, 169(1927)) the relationship $C_1/C_2 = K(T_2 - T_1)$, connecting the temp. and consistency of tar, is true within the limits of exptl. error over ranges of temp. as large as 10°, as shown by examn. of the figures given by M. and S. The value of K changes abruptly at certain temps. depending on the nature of the tar, and such changes probably indicate a sudden alteration in the phys. properties of the tar. The temp. interval is large enough to satisfy the requirements of works tests, which are generally carried out to enable faulty batches to be corrected or to make adjustments to the still. In such a case, even if there is a transition pt. between the 2 temps. at which the tar is tested, the value calcd. for the consistency at standard temp. will be sufficiently close for the purpose. A. PAPINEAU-COUTURE

Investigation of the steam-volatile neutral oil of generator tar. ERWIN KARY. *Braunkohle* 26, 577-83(1927).—Lignite generator tar was distd. with steam at 100°. The neutral oil, from this distillate, redistilled in vacuum, was investigated as follows. The portion which could be pptd. by an acidified ferrocyanide soln. increased on long standing and this was attributed to "auto-oxidation" of unsatd. constituents. The oil recovered from the ferrocyanide addn. products had 2-4 times the O content of the original neutral oil and yielded a semicarbazone, $C_8H_{13}ON_2$, corresponding to an unknown ketone, $C_7H_{14}O$, probably the "auto-oxidation" product of one of the hydroaromatic hydrocarbons, whose presence in the neutral oil was indicated by the reaction with mercuric acetate. Aliphatic olefins could be demonstrated only in small quantities. One fraction of the neutral oil was sepd., by treatment with a little methanol, into an immiscible (raffinat) and a miscible (ext.) portion. The "extract" was entirely oxidized by mercuric acetate, indicating that it contained no appreciable quantity of paraffins. F. S. GRANGER

Removal and recovery of tar acids from ammonia still effluent by means of activated carbon. ROBINSON BROS. *Gas J.* 179, 546(1927).—The liquor is acidified with CO_2 or other acid until acid to litmus and allowed to settle and then run through a series of adsorbers contg. activated C. The adsorbers are cut out in turn, freed from phenols by steam distn. and then returned to the circuit. In 6 runs an efficiency of removal of phenols of over 95% was obtained. A new activated C has been developed which is more active towards phenols than any other examd. R. W. RYAN

Decolorization and deodorization of phenols extracted from lignite oils. A. MAILHE. *Bull. soc. chim.* [4], 41, 1062-4(1927).—See C. A. 21, 1880. A. P.-C.

Researches on the reduction capacity of coke. G. AGDE AND H. SCHMITT. *Z. angew. Chem.* 40, 1003-8 1027-32(1927).—Previous work on this subject is critically reviewed. A lengthy bibliography is given and methods used are classified into qual., quant., and technical. To det. the factors involved in the reducing abilities of cokes expts. were carried out by heating various cokes such as a model coke made from nearly ash-free soot and pitch; pitch and graphite, pitch coke, and some com. cokes in a tube through which dry CO_2 was passed. Data were taken on the rate of flow of gas, analyses of effluent gases, temp. of tube, size and condition of coke particles, and duration of run. Two diagrams illustrate the description of app. used. Temps. varied from 600° to 1000°. Results are summarized in 8 tables and 11 sets of curves, some showing the progress of reduction. The differences in reduction capacities of cokes appear to be due as much to their actual chem. compn. as to the condition of the surfaces of the cokes. W. W. HODGE

Experiments on the combustibility and the strength of metallurgical coke with a coarse grain. II. F. HAUSER AND R. BESTEHORN. *Ber. Ges. Kohlentech.* (Dortmund-Eving) 1926, 457-88; *Chem. Zentr.* 1926, II, 2249.—Continuing and extending

earlier expts. (*Ber. Ges. Kohlentechn.* (Dortmund-Eving) 1925, 345; cf. *C. A.* 20, 982), the present work deals with the influence of various oven temps., chamber dimensions, type of coal used for coking, grain structure of the coal, addns. to the coal, method of quenching and crushing of the coal on the combustibility and on the strength of the resulting coke. The results show that the finer the grain of the coke the better are the combustibility and the strength of the coke. Grinding of the coal also leads to a better blending of the different components. Compared with careful hand quenching, dry cooling of the coke gave less small coal, whereas the combustibility and strength of the wet quenched coke were slightly superior. The S contents were the same; that of the dry cooled coke was somewhat more difficult to ignite. The combustibility of coke was hardly changed by crushing the coal, while the strength of the coke was increased by this treatment.

C. C. DAVIS

New ideas in coking and gasification. DRAWE. *Gas u. Wasserfach* 70, 904-5 (1927).—Coal dried with flue gas had a tendency to go through the boiler grates. This was remedied by maintaining a deeper fuel bed. In coking lignite in a rotating retort, the escape of gases and uniform coking were facilitated by the use of an angle iron plow which furnished a channel for the escape of gases. The use of O in gas producers is discussed. The price of O is the controlling factor. Gas of higher calorific value undiluted by N can be secured even from lignite. Analyses and cost data are given.

R. W. RYAN

The production of gas from lignite semi-coke. M. DOLCH. *Braunkohle* 26, 301 11(1927).—For the purpose of studying the merits of proposed finishing or degassing processes for semi-coke, specimens of 4 different commercial lignite semi-cokes were analyzed and investigated similarly with reference to gas yield, heat units in gas per ton of coke, % of the original heat value of the coke obtained in the gas, and gas compn. Sets of curves are given in which these, resp., are plotted against finishing temps. The results are analyzed and discussed at length with reference to economic efficiency. The lowering of the value of the residual coke, due to loss of fuel value, increased ash content and alteration of structure is an important consideration. The general conclusion is unfavorable to the future of the process.

F. S. GRANGER

The removal of carbon monoxide from coke-oven gas. W. GLUUD AND G. SCHNEIDER. *Ber. ges. Kohlentechn.* 2, 30-50; *Chem. Zentr.* 1926, II, 2516.—Processes for the removal of CO according to the reaction: $\text{CO} + \text{H}_2\text{O} \rightarrow \text{CO}_2 + \text{H}$, through absorption in $\text{CuCl}_2\text{-NH}_3$ soln., or in $(\text{HCOO})_2\text{Cu}$ soln., are not suited to the removal of CO from compressed coke-oven gas. The Berthelot process which utilizes the reaction: $\text{NaOH} + \text{CO} \rightarrow \text{HCOONa}$ (cf. *Ann.* 97, 125(1856); *German Patent* 212,844) was more closely examd. The process of Fa. Köpp & Co. (*German Patents* 209,417 and 212,641) was found the most satisfactory in operation, CO being washed out with dil. NaOH or Na_2CO_3 until it could no longer be detected analytically. The NaOH is completely transformed into HCOONa, but absorption of the remaining part continues for a prolonged period if the gas is treated with a counter-current of hot aq. NaOH. Essentially more favorable was the result when the gas was passed through the liquid at 230° under 60 atm. pressure. Under these conditions it was found unexpectedly that the CO_2 content of the washed gases increased when the soln. was satd. with CO. A sep. expt. showed that HCOONa and NaOH reacted partially according to the equation: $3\text{HCOONa} + \text{NaOH} \rightarrow 2\text{Na}_2\text{CO}_3 + \text{MeOH}$. Still on treatment of HCOONa with illuminating gas at 230° and 60 atm. the reactions: $2\text{HCOONa} \rightarrow \text{Na}_2\text{CO}_3 + \text{CO} + \text{H}_2$ and $\text{Na}_2\text{CO}_3 + 2\text{CO} + \text{H}_2\text{O} \rightarrow 2\text{HCOONa} + \text{CO}_2$ might take place, and in the presence of hot HCOONa the reaction: $\text{CO} + \text{H}_2\text{O} \rightarrow \text{CO}_2 + \text{H}_2$. When CO_2 humidified to 80% and CO_2 -free was passed through fused HCOOK at 280°, large quantities of CO_2 were evolved. At higher temps. the CO_2 content became negligible, while the H content increased from 6% at 280° to 16.1% at 350°.

C. C. DAVIS

The causes of the difficult inflammability of dry quenched coke. W. MELZER AND F. BACKENKÖHLER. *Ber. ges. Kohlentechn.* (Dortmund-Eving) 1926, 489-98; *Chem. Zentr.* 1926, II, 2249.—The d., kindling point (by the method of Bunte and Kölmel) and porosity and surface condition of various kinds of coke were investigated, each kind being sepd. into 3 layers for examn.: (1) the cauliflower-like outer layer; (2) the center section, and (3) the tar seam. Each kind of coke was examd. after quenching wet, dry (by inert gases), with solid CO_2 and with coned. NH_4OH . The outer layers of each sample showed higher kindling points than the inner, and the dry quenched cokes showed higher kindling points than the wet quenched ones, those quenched with CO_2 and with NH_3 showing intermediate values. Conclusion: The kindling temp. is influenced by the temp. of the quenching agent, by the time consumed in the quenching operation and by the particular quenching agent. During

quenching, steam enters the pores of the coke, and this influences the kindling point. By agitating the incandescent coke, the steam is decomposed and the liberated O oxidizes either the difficultly inflammable C modification on the surface of the coke or activates the surface (from the point of view suggested by Ruff). If this conception is in agreement with the actual phenomena, coke which has been quenched without the use of agents which liberate O must kindle with more difficulty than wet quenched coke of the same origin. This was shown to be true by the fact that the kindling point and surface structure of coke quenched with NH_4OH was intermediate between wet and dry quenched coke and that the properties of coke quenched with CO_2 were similar to those of dry quenched coke.

C. C. DAVIS

Recovery of waste heat from coke by dry quenching. ANON. *Power* 66, 404-5 (1927).—The coke is cooled by a continuous current of flue gases which then pass through a specially designed waste-heat boiler.

D. B. DILL

Apparatus for the dry quenching of coke, and plant for sorting coke at the Langenthal gas works. FRITZ AEBERHARD. *Monats.-Bull. Schweiz. Ver. Gas- u. Wasserfach.* 6, 167-73; *Chem. Zentr.* 1926, II, 1355.—A detailed description of the plant for the dry quenching of incandescent coke by means of the direct transference of heat to water in double-walled receptacles, for grading coke into sizes and for the mech. discharge of coal. Operating data are included.

C. C. DAVIS

The specific heat of lignite and lignite semicoke. KARL D'HUART. *Braunkohle* 26, 341-5 (1927).—A general review of existing data with the following conclusions. The av. sp. heat of dry lignite, between 0° and 100° , is about 0.25. The effect of the ash content is negligible and that of the moisture additive. The sp. heat of semicoke of known compn. can be calcd. additively from the sp. heats of graphite, quartz, water and the other volatile constituents.

F. S. GRANGER

Calculations, principles and the economy of the conversion of ethylene present in coke-oven gas into alcohol. W. GLUUD AND G. SCHNEIDER. *Ber. ges. Kohlentechn.* 2, 5-22; *Chem. Zentr.* 1926, II, 2516.—The calcn. is based on the treatment of 120,000 cu. m. of crude gas per day. It showed, with a plant investment of 200,000 marks, a charge of about 20.1 pfennigs per kg. of 90% EtOH , and with an investment of 100,000 marks, about 17.3 pfennigs. The calcn. of the costs was carefully carried out, and was based on lab. expts. on the chief washing process, assuming about 80% satn. of the acid. The process of Tropsch and Dittrich (cf. *C. A.* 19, 2793) offers no advantages.

C. C. DAVIS

Iron minerals utilized in high coke furnaces in Italy. GIUSEPPE TOMARCHIO. *Met. italiana* 18, 294-307 (1926).—Monograph on the practices and analytical methods used in connection with certain Italian coke furnaces. The following topics are taken up: sampling, detns. of moisture, SiO_2 , Fe, Mn, Al, CaO, MgO, P, S and loss on ignition. A list of the domestic and foreign minerals used is given, together with tables of their compn.

ROBERT S. POSMONTIER

Test of the capacity of a coke-producer plant at the Berlin-Neukölln gas plant. F. PLENZ. *Feuerungstech.* 15, 232-4 (1927).—The producer had water-cooled walls. Many details of the 7 tests are given; the av. thermal efficiency was 87%, the cold gas efficiency 80%.

ERNEST W. THIELE

Modern coking and by-product installations in Germany, Belgium, Holland and France. ANON. *Gas World* 87, No. 2252, Coking and By-Product Section, 13-32 (1927).—A description of modern coke-oven and by-products installations visited by the British Coke Oven Managers Association in Europe.

R. W. RYAN

The historical development of the design of the by-product coke oven. R. A. MOTT. *Fuel in Science and Practice* 6, 373-80 (1927).—An illustrated review.

Ignition of natural gas-air mixtures by heated metal bars (COWARD, GUEST) 2. Is the production of water-free motor fuel a luxury or a necessity? (FRITZWEILER) 16. The electrical conductivity of vapors and liquid drops during incipient combustion (BENNETT) 2. Ionization in flames of various organic substances (BENNETT) 3. Electrolysis of mains by stray currents (SARRADE) 4. Aromatic and hydroaromatic compounds of lignite tar (HERZENBERG, RUHEMANN) 10. Bituminous emulsion for use in briquets (U. S. pat. 1,643,675) 22. Concentrating apparatus for coal (U. S. pat. 1,644,112-3) 1. Device for introducing or discharging materials to or from reaction vessels operating under high pressures (Brit. pat. 262,901) 1.

Motor fuel. S. P. MARLEY and WM. A. GRUSE. U. S. 1,645,109, Oct. 11. Volatile petroleum products such as gasoline are mixed with phenetidine, anisidine or other suitable alkoxy deriv. of an aromatic amino compd., in order to restrain knocking.

Controlling fuel combustion in furnaces. J. W. GRISWOLD. U. S. 1,644,123, Oct. 4. A portion of exhaust products of combustion is withdrawn from the furnace, mixed with air, and combustible constituents in the gases withdrawn are burned; the supply of combustion-supporting gases to the furnace is controlled by differences in temp. of the exhaust gases before and after combustion of their residual combustible constituents, so as to maintain a min. of combustible material in the exhaust gases. An app. is described. Cf. C. A. 20, 2407.

Fuel briquets. H. F. LEISSNER. Swed. 63,512, Aug. 16, 1927. Straw and similar materials are pressed into briquets by applying a high pressure at a temp. sufficiently high to secure an efficient binding. The temp. should not be so high that carburization will commence.

Utilizing bituminous alum slate and other fuels with high ash content. S. V. BERGH. Swed. 63,296, July 12, 1927. Mech. features of crushing and sorting for obtaining the highest possible output.

Ammonia and organic acids by destructive heating of peat. G. H. HELLSING and O. L. CHRISTENSON. Swed. 62,811, April 19, 1927. The gaseous products from the retorts or producers are condensed in two or more steps. In the first step are condensed all the org. acids and the NH_4 salts of such acids, the tar substances and at least sufficient water for keeping the acids and salts in soln. In the second step are condensed the remaining amt. of ammonia and tar and more water. The temp. and absorption conditions in the first step are regulated by returning into the absorption app. a suitable amt. of the condensate after it has been heated or cooled to the desired temp. The solns. are worked separately for ammonia and org. acids.

Apparatus for drying, degasifying, gasifying or hydrogenating coal, etc. J. TRAUTMANN. Brit. 262,791, Dec. 8, 1925.

Producer gas. H. NIELSEN and B. LAING. Brit. 262,834, June 20, 1925. Producer gas rich in CO is made by passing CO_2 through a retort contg. semi-coke at a temp. of 750–850°. The semi-coke is obtained by distn. at 400–800°. An app. is described.

Enriching producer gas with a high water content. C. P. FISKE and A. BYSTRÖM. Swed. 61,857, Nov. 2, 1926. Gas produced from fuels contg. much H_2O , such as saw mill waste, peat, etc., are enriched by addn. of oil at a point before the regenerator and under such conditions that the H_2O vapor will react with the oil under the influence of the high temp. in the regenerator forming combustible gases.

Coke oven. W. H. WRIGHT. U. S. 1,643,532, Sept. 27.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

The petroleum industry in 1926. RICHARD KISSLING. *Fortschrittsber. Chem. Ztg.* 1927, 78–84.

Analysis of ashes from Baku crude oil. V. A. SILBERMINZ. *Neftyanoe Khozyaistvo* 12, 843–4(1927).—The following elements were found: Fe, Ca, Mg, sometimes S, P, As, Si, Al, traces of Ag, Au, Mn, Pb.

Comparison between American and Russian gasolines. S. NAMEKIN. *Neftyanoe Khozyaistvo* 12, 52–6(1927).—Tables are given of tests for 9 brands of American and 2 of Russian gasolines. The American gasolines contain 8–9 and up to 20% of unsatd. hydrocarbons, the Russian below 1%. American gasolines are blended with cracked gasoline which gives a better quality fuel with regard to knocking than the Russian, the latter being a straight-run product.

The origin and constitution of naphthenic acids. B. TIUTIUNNIKOV. *Neftyanoe Khozyaistvo* 10, 797–806; *Chem. Zentr.* 1926, II, 2519–20; cf. C. A. 18, 2423.—A no. of hypotheses assume that the naphthenic acids are formed at the same time as the hydrocarbons of petroleum and from the same parent substances. According to the theory of org. origin, unsatd. acids from fats would then be the parent substances of naphthenic acids, and the satd. acids of the fats would accompany the naphthenic acids in petroleum. To explain the absence of these satd. acids, aluric acid, stearic acid and 3 naphthenic acids were boiled for 21–24 hrs. with 20% of diatomaceous earth.

Two of the last acids lost less CO_2 than the lauric acid and stearic acid. To prove the formation of naphthenic acids from acids of the oleic acid series, com. cod-liver oil and olive oil were distd. with 20% of the decolorizing powder "Silicia." The only product was a neutral oil consisting chiefly of (1) unsatd. hydrocarbons and of compds. which are apparently ketones and (2) unsatd. aliphatic acids, oxidation of which by KMnO_4 yielded hydroxy acids which m. approx. 36° and give Cu salts sol. in benzene. From cod-liver oil were obtained di-acids but no naphthenic acids. Another group of hypotheses considers the naphthenic acids as secondary transformation products of hydrocarbons. By atm. oxidation of petroleum, however, few or no naphthenic acids are formed. It is thought by T. that this is because of too energetic oxidation, in fact atm. oxidation of Mn naphthenate at $110\text{--}120^\circ$ for 20 days yields sp. heavy acids of peculiar odor which give no Et esters with fruit odor and no Cu salts sol. in benzene and which closely resemble the acids obtained by energetic oxidation of vaseline oil. When oxidized with KMnO_4 , these acids form di-acids with acid no. 243, sapon. no. 296 and cryoscopic mol. wt. 348. Similar di-acids, which are obviously formed by oxidation-condensation of naphthenic acids, thus: $-\text{Me} + \text{Me}- + \text{O} \longrightarrow -\text{CH}_2\text{CH}_2- + \text{H}_2\text{O}$, were also obtained, together with AcOH and butyric acid, from naphthenic acids by oxidation with KMnO_4 . Further oxidation by CrO_2Cl_2 was attempted by adding dropwise CrO_2Cl_2 in CS_2 to the acids in CS_2 . With solns. over 5% concn., the reaction mixt. turned to a gel which, besides a product of CS_2 and CrO_2Cl_2 , consisted of Cr derivs. of the acids which were probably keto acids, since on oxidation they yielded naphthenic acids of low mol. wt. The acid no. of the keto acids was only slightly lower than that of the original naphthenic acids. They had a higher d. than water, were sol. in EtOH, Et₂O and C_6H_6 and insol. in petr.-ether. The Et esters did not have a fruit odor and the Cu salts were not sol. in benzene.

C. C. DAVIS

The near future of naphthene petroleums. K. KOSTRINE. *Neftyanoe Khozyaistvo* 9, 754-6(1925); *Chem. Zentr.* 1926, I, 2990.—Because of the poisonous properties of PhEt_4 , attention is being given to the utilization of naphthenes or C_{10}H_8 (though the combustion of C_{10}H_8 involves the formation of C) as anti-detonators. Since the anti-detonator effect usually increases with the proportion of C in the mol., and since hydrocarbons poor in H have higher ds. than hydrocarbons rich in H, of the same b. ps., the fuel with the higher d. for a given b. p. shows the highest temp. of explosion. In this respect Baku benzine is superior to all American products.

C. C. DAVIS

The behavior of oils with reference to freezing and melting. H. VOGEL. *Erdol u. Teer* 3, 534-9(1927).—In a mixt. of liquids which form both amorphous and crystalline solids such as the mineral oils, the cold point or pour point fails as a characteristic const., because of great variation, due to supercooling, etc., in the hands of different operators. Much more exact (within 1°) is the point of initial flow proposed by V. The app. for detg. this is a modification of the Vogel-Ossag viscometer, a U tube with a narrow and a wide arm, supported by side tubes, in an unsilvered Dewar vessel, about 4 cm. wide and 18 cm. deep. The sample in the U tube is cooled by solid CO_2 and alcohol, until completely solid. A pressure of 60 cm. water column is then applied through the side tube, to the wide arm closed by a rubber stopper and thermometer dipping into the sample, which is allowed to warm up slowly. The alc. is agitated with a stream of air, and the temps. of both oil and alc. are noted at which the level of the oil, in the narrow arm, originally at mark (1), passes mark (2) slightly above it. This is the point of initial flow. If the above app. is not available, a simpler one, described in Holde, 6th ed., page 11, may be substituted. For further information, the viscosity curves, with ascending and descending temps., are detd. in the same app. by measuring the time required for the oil level to rise from mark (3) to mark (4) in the narrow arm, under 60 cm. water pressure on the wide side, at various temps. The viscosity is calcd. by multiplying by a factor, obtained by standardization with an oil of known viscosity. The mean of the temps. inside and outside of the U tube, which should not differ by more than 3° , is the one taken. By trial with a number of different types of oils, some giving a good deal of paraffin and some not, it was found that the rising-temp. curve lies above the falling-temp. curve in the range where paraffin crystals are present. The difference is a measure of the paraffin content. The point beyond which the two curves coincide shows the m. p. or disappearance of the A. S. T. M. cold point. But with the others, the former varied from 19° below to 13° above the latter and extensive super-cooling capacities are shown.

F. S. GRANGER

The thermodynamics of oil refining as bearing on the design of plant. W. C. MITCHELL. *J. Inst. Petroleum Tech.* 13, 481-6(1927).—An address. Fuel economy and fractional distn. are especially discussed.

GEORGE CALINGAERT

Method of determination of paraffin in petroleum products. N. CHERNOSHUKOV. *Neftyanoe Khozyaistvo* 9, 77-80(1925); *Chem. Zentr.* 1926, II, 2521.—Pour into a graduated cylinder 10 g. of sample, shake until dissolved with 10-15 parts of petr.-ether (with fractions below 80° removed). add 15-20 cc. of H_2SO_4 (d. 1.84), shake 5 min. and let settle 1 hr. If the benzene layer is colorless, even though turbid, read its vol. Evap. 50 or 100 cc. to 10-15 cc., add immediately 30-40 cc. of Et_2O and then 30-40 cc. of $EtOH$, maintaining the temp. at -20° . The ppt. of paraffin must be rapidly filtered under suction. If the benzene is turbid it can either be neutralized with 2.5% $NaOH$ or mixed with fuller's earth and exdtd. with petr.-ether. A correction for the soly. of paraffin in $EtOH-Et_2O$ is unnecessary, contrary to Holde. The $EtOH-Et_2O$ mixt. can, if desired, be replaced by butanone. The paraffin content obtained by this method varies about 10% according to whether the sample is first distd. or not. In general the results are somewhat higher than those obtained by the method of Holde. If the paraffin soln. is first pptd. at 0° and then the filtrate at -21° , the paraffin is sepd. into hard and soft fractions, the relative quantities of which can thus be detd. C. C. D.

Determination of tarry substances in oil products. N. CHERNOZHUKOV. *Neftyanoe Khozyaistvo* 12, 697-8(1927).—Five cc. H_2SO_4 (d. 1.84) and 5 cc. of oil product to be tested are poured carefully into a graduated 15-cc. container, and shaken vigorously for 5 min. If a clear soln. is not obtained add 1-2 drops of naphthenic acid, shake and centrifuge for 5 min.; a clear sepn. is then obtained. A. A. BOEHTLINGK

Standard types of the American cracking industry. SEDLACZEK. *Teer* 25, 245-8, 332-5, 418-20(1927); cf. *C. A.* 20, 3559.—A description of standard app. used in the Burton, Burton-Clark, Dubbs, Greenstreet, Hall, McAfee, Rittmann, Cross, Fleming, Jenkins, Coast-Costen and Isom processes. F. S. GRANGER

Ozocerite. K. MARKOV. *Neftyanoe Khozyaistvo* 9, 767-88; *Chem. Zentr.* 1926, I, 2990.—Survey of the nomenclature, chem. and phys. properties, use, extn. and industrial treatment of ozocerite and of ceresin and its substitutes. A. L. HENNE

Estonian oil shale and its processing. G. BANDTE. *Erdöl u. Teer* 3, 567-8, 583 5(1927).—A general discussion. F. S. GRANGER

New experiences in the field of the utilization of bituminous rock. W. LANDGRAEBER. *Feuerungstech.* 15, 182-3(1927).—A new installation in Stuttgart is briefly described. The distn. residue is burned to provide heat for the distn.; after burning it is used to make *portland cement*. ERNEST W. THIELE

Kerosene and its uses. W. A. WOODROW. *J. Inst. Petroleum Tech.* 13, 398-401 (1927).—A description of the properties of kerosene of various origins and of its uses. GEORGE CALINGAERT

Burning tests of kerosene. W. H. THOMAS. *J. Inst. Petroleum Tech.* 13, 402-9 (1927).—A description of the Saybolt and other methods of testing the burning qualities of kerosene. GEORGE CALINGAERT

The burning of mineral oils in wick-fed lamps. J. KEWLEY and J. S. JACKSON. *J. Inst. Petroleum Tech.* 13, 364-97(1927).—Various grades of kerosene are burnt in wick-fed lamps and the candle-power, brightness and tendency to smoke are studied as a function of boiling range, viscosity, capillarity, S content and chem. compn. High viscosity and high carbon content (aromatics?) cause carbonization of the wick. S causes the white bloom on the chimney. Capillarity detcs. the type of wick to be used. GEORGE CALINGAERT

Detonants and antidetonants. RAFFAEL ARIANO. *Giorn. chim. ind. applicata* 8, 473-6(1926); cf. *C. A.* 21, 2380.—The action of antidetonants accords chiefly with the nuclear theory of Callendar. ROBERT S. POSMONTIER

Spectroscopy of the flame in an explosion motor. A. HENNE and G. L. CLARK. *Compt. rend.* 184, 26-8(1927).—The relationship between detonation and the length of the spectrum was investigated. Three spectrum series were photographed with a motor running normally, then with heavy detonations and finally with a fuel to which anti-detonant compds. were added. The detonation is a forceful liberation of energy, developed almost entirely in the first quarter of the explosion. Only a very small part of the detonation plays a role in the second half of the explosion. The explosion is regulated by an anti-detonant compd. in such a manner, that the energy liberated by time unit varies little during the combustion, similar to the combustion in a normally running motor. The fact that the lines of Pb appear only in the first quarter of the explosion indicates that the action of the catalyst is only to release the reaction. Many explanations have been offered to elucidate the mechanism of the action of the various anti-detonants. Though correct for certain definite substances, none of them includes all the known anti-detonants, or explains the difference of the influence of compds. of similar constitution. J. A. SZILARD

Production of ashless coke from mineral oil. V. F. GERR AND G. P. UL'YANOV. *Neftyanoe Khozyaistvo* 12, 840-2(1927).—By baking oil-coke or pitch in closed containers at high temp. a product of a very low ash content is obtained. Its applications for electrodes, etc., are discussed and the plant for its manuf. is described.

A. A. BOEHLINGK

The iodine number of transformer oils. V. D. HEYDEN AND K. TYPEK. *Erdöl u. Teer* 3, 471-2(1927).—Efforts are lately being made to classify transformer oils according to their I nos., hitherto little considered in the judging of mineral oils because of lack of relationship to the behavior of the oil in use. To test their value for this purpose the I nos. of several specimens of Russian, German and American transformer oils, in some cases, before and after use, caustic treatment and tar-formation no. oxidation (passing O_2 through the oil for 70 hrs. at 120°) were compared with the % sol. in H_2SO_4 and the tar-formation no., with reference to German and Swiss patent specifications. No correlation was found.

F. S. GRANGER

Evaluation of transformer oils. J. G. FORD. *Ind. Eng. Chem.* 19, 1165-71(1927).—The method used was oxidation in beakers in an air oven at 80° , 100° , 110° or 120° . There is a definite relation between sludge formed and unsatn. Unsaturated compds. are preferentially oxidized. Mixts. of naphthenes of high mol. wt. with paraffin hydrocarbons give an oil with high resistance to oxidation. Temps. other than operating temps. will give false indications as to oxidizability of an oil.

BRIAN MEAD

Deposits in transformer oils. M. STRUNNIKOV. *Neftyanoe Khozyaistvo* 9, 81-3(1925); *Chem. Zentr.* 1926, II, 2521.—Methods of testing transformer oils were investigated. The ppt. obtained by conducting air or O through an oil, the quantity of which is a measure of the unsuitability of the oil, cannot be detd. volumetrically and must be weighed. Air can be used in place of O , though the quantity of ppt. formed in a given time is about 10% less than that formed by O in the same time. Oxidation with Na_2O_2 also gives consistent results. A transformer oil contains at the most 0.007% ash.

C. C. DAVIS

The oxidation of insulating oils. N. BUTKOV. *Erdöl u. Teer* 3, 551(1927).—Several transformer oils of different grades of purity were tested, by the usual methods, and heated in a bomb with O_2 at 14 atm. and 150° for 5 hrs. Less-refined and totally unrefined oils were oxidized very little as compared to oils "over-refined," with fuming H_2SO_4 , or non-sludging oils. This was attributed to catalytic action. Anti-oxidants greatly repress the oxidation, which was measured by O_2 absorbed and $CO_2 + CO$ formed. Sludge formation, in the slightly oxidized oils, corresponded closely to the tar, etc. (by the Na_2O_2 method), in the oil before oxidation, but was much greater in the highly oxidized oils. The resistance of the less-refined oils to oxidation is believed to be due to the presence of anti-oxidants.

F. S. GRANGER

Testing of road oils. W. SCHAFFER. *Z. angew. Chem.* 40, 1034-5(1927).—References and some details are given for conducting the following tests which are proposed for the examn. of road oils: detns. of sp. gr., water or ammonia water, fraction boiling up to 300° , phenols, naphthalene, free hydrocarbons, drop-point, m. p., solidification point, type of pitch, viscosity and ash.

FREDERICK C. HAHN

Lubricating power cylinders of Diesel engines. Report of tests conducted to show ill effects of oxidation. W. O. NORTHCUTT. *Mech. Eng.* 49, 1068-70(1927).—An improved lubricating-oil injection tube, consisting essentially of a ball check valve with a spirally grooved plug at the cylinder end with 2 oil feed lines from the mech. lubricator, is suggested as a means of preventing oxidation of the oil. The valve is set in the cylinder wall at a point between the 2 upper rings when the piston is at the bottom in order that the rings may distribute the oil. The grooves prevent the oil from being whipped out into the cylinder when the rings pass over the valve. Analyses of oils before and after tests are given. N. believes that with proper attention to methods of lubrication the life of the cylinder linings and piston rings will be prolonged regardless of the nature of the crude oil from which lubricating oil was properly refined.

T. E. RONAN

Contribution to the knowledge of "berginization" and a study on the technical chemical investigation of hydrocarbon mixtures. I. H. I. WATERMAN AND J. N. J. PERQUIN. *J. Inst. Petroleum Tech.* 13, 413-23(1927); cf. Waterman and Perquin, *C. A.* 19, 395.—A comparative summary is given of the refractive indices and dispersive power of several samples of hydrocarbons of different groups. It is suggested to test the purity of hydrocarbons by their index of refraction, the bromine value (McIlhiney) and the detn. of mol. wt. (Victor Meyer and Rast methods). This method of investigation was applied to the products obtained by cracking paraffin wax in the vapor phase, in vacuum. Notwithstanding the high temp. used ($450-60^\circ$) for 4 hrs., no cracking occurred, the reason being that the time in the cracking spiral was only 4 sec. In the

cracking of paraffin wax with 10–12% of AlCl_3 at 250–60° for 1 to 4 hrs., there remained a residue (about 56%) in one expt. which proved to be unchanged paraffin wax, while during the cracking 25 to 30% of gasoline had been formed from the part of the paraffin wax which was decompd.

GEORGE CALINGAERT

Asphalt tars. I. Terminology, methods of testing and standards. II. Characterization of the asphalt tars of the U. S. S. R. (Soviet Republic). A. SAKHANOV AND L. SHERDEVA. *Neftyanoe Khozyaistvo* 10, 393–7; *Chem. Zentr.* 1926, II, 304; cf. *C. A.* 19, 3158.—*Asphalt tar* signifies the partly solid or solid residue from the distn. of naphtha tar, a definition which comprises soft asphalt, hard asphalt, glass asphalt, petroleum pitch and residuum asphalt. Blown asphalt obtained by oxidation of naphtha tar by air should be called “oxidized asphalt tar,” and the asphalts obtained by sulfonation of naphtha tar and from the acid residues of the production of asphalt should be called “sulfonated” and “regenerated asphalt tar,” resp. Moreover pitches from petroleum tar and from coal tar should be called asphalt tar. Finally fossil tars should be called “natural asphalt tars,” while “asphalt” should include natural mixts. of limestone with asphalt tar and artificial mixts. used in building. The testing comprised detns. of the ash, insol. C, softening temp., permeability, flash point, extensibility and d. In part II the results of tests of 17 Russian asphalt tars are compiled.

C. C. DAVIS

Asphalt and tar. P. SCHLÄPFER. *Monats.-Bull. Schweiz Ver. Gas Wasserfuchm.* 5, 85 8, 124–30, 173–5, 364–74; *Chem. Zentr.* 1926, II, 143.—Bituminous materials for street construction are classified in 3 chief groups: (1) petroleum asphalts, (2) coal tar products, and (3) special products (emulsions, mixts., etc.). The 1st group is in turn divided into (1) natural asphalts, including true asphalts or mineral pitches, asphaltites or glance pitches and asphalt rocks (asphaltic lime and asphaltic sands), and (2) artificial asphalts, which include on the 1 hand thick liquid to soft solid and on the other hand hard pitch-like distn. residues, both of which are predominantly petroleum products with an asphalt base. The formation of asphalts in nature from petroleum with an asphalt base depends upon the action of O and of S and upon polymerization. The naphthenes, olefins, terpenes, aromatic hydrocarbons and petroleum resins are by far most subject to these influences. Asphaltenes are formed after the formation of asphaltogenic acids as intermediate products. The asphaltenes are sol. in C_6H_6 and in CHCl_3 , and are transformed in turn to asphaltites and carbenes, which are almost insol. in these solvents. In regard to their sepn., classification and nomenclature there is still no agreement among individual investigators. For the valuation of asphalt for street building materials, the phys. properties are of special importance, and they are independent of the chem. character of the materials.

C. C. DAVIS

Decomposition of wood on heating under pressure in alkaline solutions. ERIC HAGGLUND. *Svensk Kem. Tids.* 39, 90–6(1927).—Wood shavings were treated with H_2O and varying quantities of NaOH (0–30 g. per 100 g.) in an autoclave at 350° (200 mm.). The results are presented in extensive tables. The gas evolved consisted mainly of H_2 and CH_4 .

A. R. ROSE

Phenols from coniferous wood tar. PETER KLASON AND HJ. MELLQUIST. *Svensk Kem. Tids.* 39, 75 80(1927).—Distil. fractions of wood tar (7 fractions between 179° and 260°) gave, *p*- and *m*- but no *o*-cresol, guaiacol, creosol, ethylcreosol and a creosol with Pr, not eugenol (Pictet and Gaulis, *C. A.* 17, 3019), possibly isoeugenol. The largest fraction consisted of creosol.

A. R. ROSE

Sesquiterpenes in birch tar oil. K. A. VESTERBERG AND J. NYDAHL. *Svensk Kem. Tids.* 39, 117–21(1927).—Birch tar oil was scrubbed, dried and fractionated into 5 parts: 110–15°, 115–20°, 120–25°, 125–30° and 130–35°. The physical constns. of these are, resp.: n_D^{20} 0.882, 0.890, 0.898, 0.893, 0.987; $[\alpha]_D$ 5.6, 13.2, 21.98, 16.32, 8.4; n_D^{19} 1.493, 1.500, 1.504, 1.501, 1.502. These fractions are very likely made up of sesquiterpenes with some acids. The first one is in agreement with constns. for betulol (Semmler, *Ber.* 18, 1417). All fractions on dehydration gave a picrate, m. 127°, which is not identical with that reported by Ruzicka (*C. A.* 5, 345, 927). A naphthalene-like compd., $\text{C}_{13}\text{H}_{14}$, was recovered from the picrate with n_D^{22} 1.5872, b. 252°, indicating that part of the sesquiterpenes are bicyclic.

A. R. ROSE

Possible use of shale oil as a wood preservative (SOWDER) 20. The age of the H_2S contamination of the sea basin in the Crimea-Caucasus region and the processes of formation of petroleum (ARCHANGELSKII) 8. The determination of water in oils (PFLUG) 27. Jet and jetonized material (CRAIG) 8. Municipal water supply in the oil fields (VEATCH) 14. Bituminous composition containing rubber (Brit. pat. 263,028) 30. Filter for gasoline (Brit. pat. 263,017) 1. Tetra-alkyl Pb compounds (U. S. pat. 1,645,389) 10. PbEt_4 (U. S. pat. 1,645,375) 10.

Cracking and converting petroleum oils. W. M. CROSS. U. S. 1,643,446, Sept. 27. Oil is heated to a cracking temp. and all the oil to be treated is collected in a reaction zone while maintaining temp. and pressure conditions which will effect conversion of the oil in the liquid phase; all conversion products are withdrawn from the reaction zone in a small stream, pressure is released on the stream and steam is injected into it; the mixt. of oil and steam is then admitted to an enlarged zone maintained under reduced pressure to effect distn. of lighter fractions of the conversion products. An app. is described. Cf. C. A. 21, 1883.

Separating constituents of petroleum emulsions. G. W. COGGESHALL and A. REILLY. U. S. 1,643,698, Sept. 27. Gravity sepn. is effected after adding a sulfonated oil material such as sulfo-fatty acids of the Twitchell process and a salt soln. U. S. 1,643,699 specifies use of a soap soln. and a salt such as NaCl.

Cracking heavy hydrocarbon oils. W. S. YARD and E. N. PERCY. U. S. 1,643,401, Sept. 27. Heavy hydrocarbon liquid is sprayed upon a deep bed of solid fuel maintained incandescent in a closed chamber, the vapors formed are passed into a second chamber over a mass of finely divided carbonaceous material, elec. heated to incandescence and the vapors and carbonaceous material are subjected to the action of steam to prevent clogging of the carbonaceous material with products of the cracking and the vapors are then further passed through the carbonaceous material to effect their cracking.

Converting hydrocarbons into others of lower boiling point. E. H. LESLIE and B. R. TUNISON. U. S. 1,644,736, Oct. 11. The surfaces of bodies of liquid hydrocarbons such as a residuum oil of 14-6° Bé. and a lighter distillate are brought together, e. g., by superposing the lighter distillate on a body of the heavier oil by intermittent addition, and a temp. is maintained which will effect conversion. An app. is described.

Converting oils. W. M. CROSS. U. S. 1,644,991, Oct. 11. Oil is raised to a cracking temp. in a "heating stage," passed to a "conversion stage" and maintained under sufficient pressure from the vapor generated to maintain most of the oil in liquid phase, the pressure is then relieved and the oil is passed through a vaporizing stage and vapors evolved are subjected to fractional condensation and a portion of the condensate is returned to the heating stage and to the fractional condensation stage with the charging stock. A regulated liquid level is maintained in the vaporizing and fractional condensing stages. An app. is described.

Purification of hydrocarbons. C. WEGNER. Can. 273,682, Sept. 6, 1927. Light hydrocarbons are purified by heating with $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ and then distg.

Apparatus for fractionating petroleum oils. F. A. MILLIFF and J. A. MILLIFF. U. S. 1,644,937, Oct. 11.

Battery of continuous stills for distilling hydrocarbon oils. J. R. CARRINGER. U. S. 1,644,324, Oct. 4.

Oil gas. R. D. PIKE. U. S. 1,644,146, Oct. 4. A supply of oil is treated with steam and passed over heated surfaces in a closed chamber to convert the oil and steam into lean gas carrying suspended C particles; the lean gas and suspended C are then further heated and treated with steam in another closed chamber to convert the C into gas, and the lean gas mixt. is enriched. An app. is described.

Illuminating oil. F. W. HALL. Can. 274,478, Oct. 4, 1927. An illuminating oil is manufd. by treating a viscous hydrocarbon oil with H_2SO_4 , then subjecting the treated oil to upward filtration through fuller's earth and finally mixing the oil with a kerosene fraction of petroleum.

Manufacture of lubricating oils with low melting point from paraffin-containing distillates. AKTIEBOLAGET SEPARATOR-NOBEL. Swed. 62,844, April 27, 1927. The larger paraffin crystals formed by cooling are filtered off and the remaining paraffin is removed by centrifugalizing after addn. of a diluent lowering the sp. gr. of the liquid component. Cf. C. A. 20, 2246.

Bituminous composition. R. ILLEMANN. Brit. 262,961, Dec. 31, 1925. An elastic waterproof compn. is made by adding a liquid bituminous substance or a "mineral wax" to a heated creamy suspension of stone flour in H_2O , and boiling and stirring to obtain a stiff pasty material.

Bituminous composition for paving, roofing or other purposes. C. S. REEVE. U. S. 1,643,520, Sept. 27. A mixt. of coal-tar pitch and an oil shale is heated at about 340-50° for 5-10 hrs. U. S. 1,643,521 specifies heating oil shale and coal-tar oil together at 310-20° for 10-15 hrs.

Bituminous emulsion for use in briquets or on roads or for other purposes. J. A. MONTGOMERIE. U. S. 1,643,675, Sept. 27. Mexican asphalt which is solid at ordinary temp. is melted and poured into a dil. caustic alkali soln. at a temp. of about 102°

and the mixt. is stirred to effect reaction between the alkali and a portion of the ingredients of the asphalt.

Distilling bituminous materials. C. N. FORREST and H. P. HAYDEN. Brit. 262,959, Dec. 28, 1925. Materials such as heavy asphaltic residues or gilsonite or grahamite are distd. in the presence of a carrier consisting of pieces of inert refractory material and by the heat generated by the combustion of the coke which remains on the carrier after the distn. An app. is described.

Furnace and process for carburizing saw-mill waste. P. JOHNSON. Swed. 63,511, Aug. 16, 1927. The material is packed in crates which are hung up in retorts heated from a common fireplace. The plant works continuously.

Recovery of acetic acid. H. SUDA. Can. 274,719, Oct. 18, 1927. The mixt. of wood gases, pyroigneous acid vapors and wood spirit vapors leaving a wood carbonization app. is completely detarred and subjected in gaseous condition directly to extn. with an extn. agent difficultly sol. in H_2O and having a b. p. higher than that of $AcOH$, the $AcOH$ being completely removed from the mixt. in this manner and withdrawn in a coned. state as a liquid with the extn. agent.

23—CELLULOSE AND PAPER

CARLETON F. CURRAN

Cellulose. XXVIII. Acetolysis of cellulose. III. Formation of cellobiose. HERMANN PRIESE and KURT HESS. *Ann.* 456, 38-54 (1927), cf. C. A. 21, 2982.—In the acetolysis of cellulose with $Ac_2O-H_2SO_4$, a 50-51% yield of cellobiose octaacetate is obtained; this is independent of the cellulose material (cotton, linters, ramie, wood cellulose, mercerized cotton or acetylcellulose may be used). Expts. with cellulose triacetate, which in dil. soln. in glacial $AcOH$ has the low mol. wt. of acetylglucosan, show that the formation of cellobiose is also independent of the state of association of the cellulose deriv. The polarimetric changes during acetolysis show a similar parallelism for the different celluloses examd. Exptl. details of the acetolysis are given. **XXIX. Preparative separation of cellulose crystals from bast fibers. (I. From ramie fibers).** K. HESS and GUIDO SCHULTZE. *Ibid* 55-68.—Selected ramie fibers, repeatedly purified with alkali, Cl_2O and Na_2SO_3 until ash free ($[\alpha]_{435}^{18}$ 3.41 in cuprammonium hydroxide soln.) is acetylated for 8 hrs. at 70-75° with H_2SO_4 , Ac_2O and C_6H_6 and the triacetate dissolved out in glacial $AcOH$ or $CHCl_3$. The unacetylated cellulose appears in the form of spindle-shaped crystals, 0.05-0.1 mm. long, suspended in the soln. and may be sepd. by sedimentation from the detritus with which it is mixed. The crystals are identical chemically with pure cellulose prepd. from crystd. diacetate. The "inter-crystal substance" which is removed as triacetate, when regenerated from the latter by hydrolysis with 2 N $MeOH-NaOH$, shows in cuprammonium soln. a slightly smaller optical rotation than the crystals. **XXX. Acetolysis of cellulose with hydrobromic acid and acetyl bromide.** FRITZ MICHEEL. *Ibid* 69-86.—Cellulose acetate in 10 parts $AcBr$ contg. 5-10% HBr at 0° changes in rotation from -0.1° to 170° in 14 days; after 4.5 days the rotation is const. at about 135° for 24 hrs. The final mol. wt. (dtd. from the Br reactive with $AgOAc$ or Ag_2CO_3 in $MeOH$) indicates the complete decompn. of the cellulose. After the reaction of 5% HBr in $AcBr$ upon acetobromocellobiose at 0° for 11 days, 71% of the cellobiose was recovered; with 7.5% HBr in $AcBr$ at room temp., complete degradation took place. After reaction with $AgOAc$ in $AcOH$, equal amts. of glucose pentaacetate and a glucose acetate contg. 10% Br were obtained. Acetobromoglucose is nearly quant. recovered after the action of 7.5% HBr in $AcBr$ for 13 days. Cellulose acetate (30 g.), treated with 300 g. $AcBr$ and 18 g. HBr for 23 days at 5°, gives 9.5 g. of an amorphous *trihexosan nonaacetate*, $C_{36}H_{48}O_{24}$, m. 123-6°, $[\alpha]_D^{20}$ 86.6° ($CHCl_3$), mol. wt. in C_6H_6 , 827; in $CHBr_3$, 851; in $AcOH$, 834. It forms addn. compds. with $PhMe$, $C_6H_5Me_2$ and $CHBr_3$. Sapon. with $MeOH-NH_3$ at 0° gives *trihexosan*, m. 184-9°, $[\alpha]_D^{17}$ 90.5° (H_2O), $[\alpha]_D^{19}$ 96.8° ($MeOH$), mol. wt., H_2O 445. Methylation gives a *nonamethyltrihexosan*, amorphous, m. 84-91°, $[\alpha]_D^{19}$ 94.8° ($CHCl_3$), mol. wt., H_2O , 600. Degradation with 35% $MeOH-HCl$ at 0° for 3 days gives 2,3,6-trimethylglucoside, m. 108-10°, hydrolyzed with 5% aq. HCl to 2,3,6-trimethylglucose, m. 103-7°, $[\alpha]_D^{17}$ 70.2°.

C. J. WEST

Hemicelluloses. ROBERT HAZARD. *Russa* 2, 581, 583; *Rev. gén. mat. plastiques* 3, 505-6 (1927).—A brief discussion of the significance attached to the term "hemicellulose" by various authors.

A. PAPINEAU-COUTURE

Standard celluloses. C. G. SCHWALBE. *Paper Trade J.* 85, No. 12, 53-6(1927).—See C. A. 21, 1705. A. PAPINEAU-COUTURE

General study of the chemistry of cellulose and its principal derivatives. II. Experimental part. H. GAULT AND P. EHLMANN. *Caoutchouc & gutta-percha* 24, 13706-7(1927); cf. C. A. 21, 2794.—The caproates were prepd. by the same general methods as before. *Cellulose monocaproate* formed a tough, fibrous mass, insol. in all solvents tried, and softened around 250°. *Cellulose dicaproate* is pptd. from C_6H_6 as very fine fibers, is sol. in all the solvents of cellulose laurates, particularly in aromatic hydrocarbons, softens at 140° and m. 180°. *Cellulose tricaproate* forms a very hard granular mass and cannot be pptd. in fibrous form. It softens at 100° and m. 230°.

C. C. DAVIS

Cellulose and cornstalks. J. F. JACKSON. *Paper Mill* 50, No. 36, 2, 20(1927).—The *Dorner process* consists essentially in cooking corn-stalks (including nodes, leaves and pith) with a weak NaOH liquor for 1 hr. at low pressure, draining off the liquor, and then cooking for 5 hrs. at a slightly higher pressure with a stronger NaOH liquor. Yields of 33-35% of pulp contg. 95% α -cellulose are claimed; while if a lower α -cellulose content in the pulp is satisfactory higher yields can be obtained. A. P.-C.

Researches on benzoyl cellulose. I. KATSUMOTO ATSUKI AND KICHIRO SHIMOMYAMA. *Cellulose Ind. Tokyo* 2, 336-40(1926).—Dibenzoate of cellulose is prepd. by warming regenerated or normal cellulose (1 part), mercerized with 35% NaOH soln. and aged for 24 hrs. at ordinary temp., with NaOH (4 parts) and 20% C_6H_6 soln. of $Ph.COCl$ (10 parts) at 50-60° for 1-2 hrs. The product is poured into H_2O and washed several times with hot H_2O . The product from regenerated cellulose gives a clear soln. in $CHCl_3$ and Me_2CO and is apparently degraded to a marked extent as indicated by its low viscosity and the large Cu no. which is the main cause of the brittleness of the film. The benzoate from normal cellulose is not clearly sol. in $CHCl_3$, giving a turbid soln. The dispersion is not complete after several days and the filtration is very difficult. The viscosity of the soln. is very high perhaps because of the presence of swollen fragments of the benzoate. The film obtained has the tensile strength 5 kg. per sq. mm. and elongation 5%, but it is very brittle. The cellulose of the benzoate from normal cellulose is not so much degraded and the brittleness of the film is not attributed solely to the degradation of the cellulose. The imperfection of the dispersion seems to play also an important role in the brittleness of the film. K. K.

Decomposition of cellulose by heating under high pressure in presence or absence of hydrogen, with or without a liquid dispersing medium. H. I. WATERMAN AND J. N. J. PERQUIN. *Chimie et industrie Special No.*, 277-89(May, 1927).—See C. A. 21, 1705. A. PAPINEAU-COUTURE

Biochemical decomposition of cellulosic materials, with special reference to the action of fungi. R. D. REGE. *Ann. Appl. Biol.* 14, 1-44(1927).—In mature plant materials, pentosans form the most important food of microorganisms. These compds. are easily attacked whereas the other furfural-yielding compds. are resistant. The Klobber and Tollens method for the detn. of pentosans is not specific for these compds. R. suggests a method which requires the detn. of the furfuroids in the cellulose obtained by the chlorination method and the deduction of this value from the total furfuroids. The decompn. of ripe cellulosic materials in the presence of assimilable N is apparently controlled by 2 factors: (1) the energy factor (pentosans); (2) the inhibiting factor (lignin). If the ratio, energy factor: inhibiting factor is > 1 , the material is easily decompd.; if < 0.5 , the material is very resistant to the attack of microorganisms. By this means susceptibility to decompn. can be predicted. This ratio could not be increased by the addn. of carbohydrate to the resistant materials. Mannose and galactose are apparently not suitable food for the organisms concerned in this process. The pentosan part of hemicelluloses is most important as microbial food. Fungi are more important than bacteria in the early stages of the decompn. of cellulosic materials. The N of fungal bodies is not readily available. In the later stages of decompn. fungi are decompd. by other organisms. Certain fungi isolated from decomp. heaps of cellulosic material can grow at high temps. and on purified C constituents of plants. The presence of almost all the enzymes necessary to hydrolyze the complex C compds. was ascertained. These activities of the fungi confirm their importance in the decompn. of cellulosic materials. C. H. RICHARDSON

Correction to article by K. Hess and G. Schultze, "Cryoscopic behavior of cellulose acetates." K. HESS. *Ann.* 457, 307-8(1927); cf. C. A. 21, 2982.—Correction of certain optical activity values are given. C. J. WEST

Pulp supplies of the future. New and simple process of manufacturing bamboo cakes (semi-pulp or quarter-stuff) suitable for cheap transport. A. H. LYNN. *Paper*

Maker and Brit. Paper Trade J. 74, 65-7(1927).—A process recently developed in Germany consists essentially in removing the leaves of the bamboo, cutting the stems into suitable lengths, and thoroughly disintegrating them in a specially designed machine (not described); the disintegrated bamboo is cooked with $\text{Ca}(\text{OH})_2$ for about 10 hrs., washed, and pressed into cakes under just enough pressure to cause proper cohesion of the cakes on subsequent drying, which is carried out in the air or in a drying tunnel. The dried cakes contain from 30 to 40% more fiber than wood per unit vol., and from 5 to 15% more per unit wt. The material can be converted into soda pulp by treatment with a relatively small quantity of NaOH at low pressure. The economic possibilities of the process are briefly discussed.

A. PAPINEAU-COUTURE

The bamboo hope. W. RAITT. *Paper Maker and Brit. Paper Trade J. 74, 15-26; World's Paper Trade Rev. 88, 4-16, 84-8; Paper Makers' Monthly J. 65, 266-71; Paper Mill 50, No. 31, 16, 36-40(1927).*—An address discussing the possibilities of bamboo as a substitute for wood in the manuf. of paper, based on R.'s lab. and com.-scale expts. during the last 25 yrs. Thanks to the fractional digestion process (C. A. 8, 247; 11, 1546; 16, 1012; 19, 3590), the position arrived at now, contrasted with that of 25 yrs. ago, is as follows: knots or nodes usable, unusable; NaOH used on bamboo 16, 24%; bleach used (on unbleached pulp) 8, 22%; steaming time 5, 10 hrs.; steaming pressure 24, 80 lbs.; yield of unbleached pulp 45, 37%; yield of bleached pulp 42, 32%, resp. R. estimates that unbleached bamboo pulp can be delivered c. i. f. British ports at a lower cost than the present price of unbleached soda wood pulp. The quantities available, forest population and lime supply are discussed.

A. PAPINEAU-COUTURE

Production of pulp with high α -cellulose. G. A. RICHTER AND M. O. SCHUR. *Paper Trade J. 85, No. 8, 48-9(1927).*—See U. S. pat. 1,599,489, C. A. 20, 3566; U. S. pat. 1,602,553, C. A. 20, 3814.

A. PAPINEAU-COUTURE

Value of p_H determinations for controlling sulfite pulp manufacture. RENÉ ESCOURROU AND PAUL CARPENTIER. *Chimie et industrie 18, 13-23(1927); Papeterie 49, 690-7, 737-41, 782-6(1927).*—Contrary to Taylor (C. A. 20, 1519), E. and C. find that the acid concns. used in the sulfite pulp manuf. are not so high as to preclude the use of p_H detns. for controlling the acid making and cooking operations. The color of the liquors is such that colorimetric detns. may be used. Raw acid from the limestone towers has a p_H of about 2.0, which is reduced by about 0.4 by strengthening with relief gas and liquor in the recovery tank or tower. Improvement in results by cooking with liquor contg. neutral salts (e. g., NaCl), which is generally attributed to better penetration of the liquor into the wood, is really due to a modification of the p_H of the liquor, which is brought into the optimum zone. Addn. of chlorides lowers the p_H and addn. of sulfates raises it, presumably because of combination of a no. of H_2O mols. with each chloride mol., while the action of sulfates is due to the probable formation of addn. compds. complicated by hydration. For each species of wood there is an optimum p_H value for the cooking liquor, which is about 2.0 for resinous woods, but which also varies with the moisture content of the chips and the surface tension of the liquor. Systematic study of the variation in p_H of the liquor during 3 industrial cooks for different grades of pulp showed that it first rises (period of impregnation), then falls (disincrusting period) and finally rises again (second impregnation period). In cooking for easy-bleaching pulp, the second impregnation period is omitted and the period of disincrusting is conducted slowly and in such a manner as to obtain as low a p_H value as possible at the end of the cook, short of the point at which the liquor "turns." Important savings can be effected by re-using the water repeatedly in dilg., rifting, screening and thickening the stock, provided it is renewed whenever it becomes too heavily loaded with sol. impurities, which is readily controlled by means of p_H detns.

A. PAPINEAU-COUTURE

Some recent progress in the cellulose industries. M. BROU. *Papier 30, 841-7(1927).*—An address briefly reviewing both established and new processes, including special phases such as pulp for rayon and wood substitutes.

Sulfur recovery from relief gases and liquor. G. A. RICHTER. *Paper Trade J.*

85, No. 8, 45-8(1927).—See U. S. pat. 1,599,488, C. A. 20, 3570; U. S. pat. 1,616,703, C. A. 21, 1011.

Modified sulfite pulping process. G. A. RICHTER. *Paper Trade J.* **85**, No. 8, 56(1927).—Description of U. S. pat. (C. A. 21, 496). In pulping wood by the sulfite process using a Na instead of Ca base, a portion of the base can be supplied in the form of niter cake (NaHSO_4), and can give a high-grade pulp essentially equiv. to those produced by the usual Na base sulfite liquors. The amt. of H_2SO_4 present in the liquor is not sufficient to injure the fiber, and it promotes liberation of the fibers at a lower temp. and in a shorter time.

The chemistry of sulfite cooking. W. H. BIRCHARD. *Paper Trade J.* **85**, No. 12, 50-61(1927).—An account is given of observations made in the course of exptl. sulfite cooks in a glass digester of 540 cc capacity. Convection currents were set up that kept up a considerable circulation, and when gas was relieved from the top of the digester ebullition of the gas caused violent circulation; at no time was there appreciable difference in color of the liquor at the top and bottom of the digester. The progress of penetration of the chips by the acid was about 9 times faster from the ends than from the sides, and as the rate of penetration is the same for all chips, irrespective of size, uniform penetration requires uniform chip size. No evidence was found that lignosulfonic acid polymerizes under the conditions existing in the sulfite process; but if the temp. is raised too rapidly, before the chips have been properly penetrated and both aldehyde groups have been sulfonated, there is danger of the partially sulfonated lignin polymerizing to form insol. resins; or if the lignosulfonic acid is not neutralized by the base as rapidly as formed, it may act on the cellulose in a manner similar to H_2SO_4 . It is unadvisable to exceed 145° in cooking, as cellulose begins to decompose at about 150° . On heating sulfite liquor (5.15 total, 3.84 free, 1.31% combined SO_2) a crusty ppt. began to form at 128° and between 70 and 75 lbs. pressure. If the contents of the digester were allowed to cool, analysis of the ppt. showed it consisted practically entirely of CaSO_3 ; but if the liquor was withdrawn at max. pressure the ppt. consisted of a mixt. of $\text{Ca}(\text{OH})_2$ and CaSO_3 . This is attributed to the reaction $\text{Ca}(\text{HSO}_3)_2 + 2\text{H}_2\text{O} \rightleftharpoons \text{Ca}(\text{OH})_2 + \text{H}_2\text{SO}_3$, which proceeds to the left at low and to the right at high temps.; but as H_2SO_3 cannot exist above 120° (unpublished work by W. B. Campbell), the reaction goes to completion above this temp. Conclusion: Above 120° sulfonation of the lignin is accompanied by an alk. hydrolysis of the β -cellulose and other carbohydrates by the $\text{Ca}(\text{OH})_2$, which is the probable explanation of the production of easy-bleaching pulp cellulose with sulfite liquors high in base. This is confirmed by the fact that with such a liquor an easy-bleaching pulp was obtained which, after beating for 30 min., gave a parchment-like sheet which could not be tested with an Ashcroft tester, the stock showing unmistakable signs of hydrolysis and hydration.

The determination of the copper number. D. CLIBBENS and A. GRAKE. *Paper Trade J.* **85**, No. 12, 62(1927).—Because of C. G. Schwalbe's work on the Cu no. detn., it is suggested that all methods for this detn. be prefixed with his name, e. g., Schwalbe-Hägglund, Schwalbe-Braidy, etc. The latter has been found greatly superior to the former in testing materials with low Cu no., such as are used in the textile industry, but it may require modification for use with materials having a high Cu no., e. g., wood pulps. No evidence has been found that the swelling of cotton cellulose exercises any influence on the quant. absorption of methylene blue, such differences as have been noted being traceable to purely chem. differences rather than to differences in the degree of swelling.

New developments in artificial silk. A. J. HALL. *Dyer, Calico Printer* **58**, 50-1(1927).—The fine filaments and hollow fibers of the older rayons, and acetate silk are discussed.

Faults of artificial silk. INVESTIGATOR. *Silk J.* **4**, No. 38, 53-4(1927).—The effects of variations in denier, twist, tension, color, warping, sizes, sizing, etc., are discussed. Cf. C. A. 21, 1015.

Purification of caustic soda from viscose refuse. LEONARDO CERINI. *Giorn. chim. ind. applicata* **8**, 227-35(1926).—Description of a patented process which makes use of cotton cloths as dialyzing membranes for osmotic pressure.

Recovering alcohol and ether in rayon making. G. WEISSENBERGER. *Rayon J.* **2**, No. 4, 27-30(1927).—Modern processes and app. for washing the vapors from the manuf. of nitro silk are described and discussed.

Austrian black pine (*Pinus Austriaca*) as a paper-making material. L. VIDAL and M. ARIBERT. *Papier* **30**, 731-6; *Papeterie* **49**, 697-702(1927).—Analysis of the air-dried wood gave: H_2O 17, ash 0.5, resins (EtO ext.) 4.3, cellulose 54%. Cooking 12 hrs. at 2.5-3 kg. pressure with 20% NaOH at 5% concn. gave a 65% yield of un-

bleachable pulp, very difficult to defiber in an exptl. beater, but might be easier to treat in a kollergang. If it can be defibered satisfactorily, the pulp would be suitable only for unbleached or colored wrappings. By increasing the proportion of NaOH to 30% (at a concn. of 7.5%) and the time of cooking to 15 hrs., there was obtained 48% of reddish brown pulp, which could not be satisfactorily bleached. It was readily defibered and could withstand drastic beating. By increasing the NaOH to 35% (at a concn. of 8.75%) the yield was reduced to 45%. The latter pulp was somewhat softer, could be defibered easily and bleached to a satisfactory white with 24% of bleaching powder, giving a pulp suitable for the manuf. of fine papers. Boiling the wood 8 hrs. at a pressure of 2.5-3 kg., with 16% NaOH (at a concn. of 4%) and 8% Na₂S (at a concn. of 2%) gave 53% of brown, very strong, homogeneous pulp, which was defibered without undue difficulty. The microscopic characteristics of the pulps obtained, which are very similar to those of pulp from Scotch pine (*Pinus sylvestris*), are described in detail.

A. PAPINEAU-COUTURE

Potato-stem pulp. A micro-consideration. JAMES SCOTT. *Paper Maker and Brit. Paper Trade J.* 74, 262 5(1927).—An illustrated description of the structure of potato and tomato stems, bringing out their possibilities as paper-making materials.

A. PAPINEAU-COUTURE

The disintegration of pine by the sulfite process. C. G. SCHWALBE AND KURT BERNDT. *Cellulosechemie* 8, 66-8(1927).—Exception is taken to Hägglund's work (C. A. 21, 1710) and it is established from his own data that pine heartwood extd. with C₆H₆ or Et₂O cannot be disintegrated by the sulfite process. Hägglund's investigations, made in a bomb tube in which the factors of time, motion, acid concn., max. pressure and chip size differ from com. practice, give no conclusions of value to the technical problem of cooking pine, nor do they indicate the harmful effect from a phys. and chem. standpoint, on the reactivity of comminuted wood subjected to long storage. Cf. C. A. 20, 3810.

I. C. FLECK

Lignin acetals. ERIK HÄGGLUND AND H. URBAN. *Cellulosechemie* 8, 69-71 (1927).—When finely divided wood is treated with AmOH.HCl more than 1/2 the material is dissolved and a light brown semi-acetal, probably C₁₆H₁₀O₆.OMe.OAm, can be isolated from the soln. A lignin acetal with 2 amyloxy groups in the mol. apparently exists in the residue. Wood treated with BuOH HCl yields the corresponding butyloxy semi-acetal, C₁₆H₁₀O₆(OH)₂(OMe).OBu. These expts. indicate a mol. wt. for lignin of about 315, and that it contains one OMe, one C = O and 3 OH groups. I. C. FLECK

Industrial research paper laboratories. C. J. WEST. *Paper Trade J.* 85, No. 6, 49-53(1927).—A list of industrial research labs. working on pulp and paper or related problems, with information regarding their staffs and nature of the work carried out.

A. PAPINEAU-COUTURE

Ailanthus wood as a paper-making material. L. VIDAL AND M. ARIBERT. *Paper Trade J.* 85, No. 7, 49-50(1927).—See C. A. 21, 2062.

A. PAPINEAU-COUTURE

Paper qualities. JESSIE E. MINOR. *Paper Trade J.* 85, No. 13, 41-2(1927); cf. Nourse, C. A. 21, 2983.—A discussion showing that it is not possible to compare the qualities and permanence of 2 papers merely on the α-cellulose content of the raw materials, unless it has been first ascertained that the fibers are of the same kind, that the mech. treatment has been equally drastic, and that the chemicals added during the process of making the paper are identical and have had equal opportunity to attack the fibers.

A. PAPINEAU-COUTURE

Industrial applications of paper products. G. OEHLER. *Z. Ver. deut. Ing.* 71, 545-52(1927); *Paper Industry* 9, 795-9(1927).—Data are given on the mech. properties and machining properties of products such as resin-impregnated paper and boards, pressed boards and pasteboard.

A. PAPINEAU-COUTURE

Paper-fiber disintegration. Some minute problems. JAMES SCOTT. *Paper Maker and Brit. Paper Trade J.* 74, 27-31(1927).—A description of whole, sepd., severed and fibrillated fibers, as seen under the microscope, particularly when examg. torn papers.

A. PAPINEAU-COUTURE

Fixation of basic dyes by vegetable parchment. ABEL CAILLE. *Paper Trade J.* No. 3, 53(1927).—See C. A. 21, 2062.

A. PAPINEAU-COUTURE

Paper-making qualities of the leaves of *Corypha laevis*. F. HEIM DE BALSAC, A. DEFORGE, G. S. DAGAND AND J. MAHEU. *Bull. agence gén. colonies* 20, 51; *Bull. Imp. Inst.* 25, 167(1927).—The leaves of *Corypha laevis* (Lour.), the "Cay La Buong (lata-pier)" of Annam contain on the dry basis (H₂O 8.40%): ash 4.65, fats and waxes 0.60, cellulose 39.10, lignin 55.65%. The ash contained SiO₂ 29.26%, Al₂O₃ 13.15% and aO 49.19%. Cooking the leaves for 6.5 hrs. under a pressure of 3 kg. with a 3.5% aOH liquor gave a brownish yellow pulp which bleached white without much difficulty.

(yield of bleached pulp 32.6% on the dry basis). The pulp consists mainly of long fibers with a wide lumen, varying in length from 0.44 to 1.77 mm. (av. 1.4 mm.), and with an av. diam. of 0.010 mm. The pulp gives a "rattly" paper of little less than av. strength.

A. PAPINEAU-COUTURE

The Emanuelli (paper) porosity tester. L. EMANUELI. *Paper Trade J.* 85, No. 10, 48-50(1927).—The principle of the instrument consists essentially in passing air successively through a definite area of the paper to be tested and through a standard capillary glass tube of known vol. and diameter, and measuring the difference of pressure across the sheet and across the capillary by means of mercury manometers. The theory of the instrument, technic of its use and precautions to be observed are discussed. It has been used satisfactorily in the testing of cable papers over a no. of yrs. The impermeability of paper is defined as the reciprocal to its porosity.

A. P.-C.

Waterproofing and hardening paper by means of aluminum acetate. A. LAM-BRETTE. *Papeterie* 48, 666(1926); *Paper Trade J.* 85, No. 5, 57-8(1927).—By impregnating with $\text{Al}(\text{OAc})_3$ soln. and then drying at a low temp., the AcOH is driven off and the hydrated Al_2O_3 remains as a somewhat gelatinous, coherent film, which waterproofs and hardens the paper. At higher temps. the Al_2O_3 is completely dehydrated and becomes pulverulent.

A. PAPINEAU-COUTURE

Notes on the examination of decayed papier mâché fire buckets. A. C. THAYSEN AND H. J. BUNKER. *J. Soc. Chem. Ind.* 46, 382T(1927).—Exptl. evidence is given showing that the deterioration of papier mâché fire buckets is due solely to the activity of microorganisms. When microbiological action can be eliminated by addn. of anti-septics (e. g. PhOH) the life of such buckets can be almost indefinitely extended.

A. PAPINEAU-COUTURE

Study of clays used in paper making. W. V. TORREY. *Paper Industry* 9, 949-51(1927).—The viscosities of water suspensions of different grades of English china clays were found to vary through a considerable range. The rate of settling seems to be related to viscosity of clay "slips," those with highest viscosity being the slowest to settle. On the whole, coating grade clays settle more slowly than filler grade clays. The viscosities of the "slips" may be varied through a wide range by addn. of suitable reagents, starch and Na silicate being most efficient in reducing the viscosity, so that mixts. contg. 60% clay are rendered thin enough to be readily pumped through pipe lines. The viscosity of clay-casein mixts. is affected materially by addn. of modifying agents to the slip before mixing with casein soln.; sol. oil, alum, Na_3PO_4 and Na_2CO_3 increase the viscosity, while $\text{Ca}(\text{OH})_2$, starch and Na silicate decrease it. The changes in viscosity effected by the use of modifying agents with the clay are less marked when satin white is present than in a mixt. contg. clay and casein only.

A. PAPINEAU-COUTURE

Colloidal chemistry in paper making. RUDOLF LORENZ. *Bumazhnaya Promishlennost* 6, 88-93(1927); *Paper Trade J.* 85, No. 12, 56-8(1927).—A discussion showing that paper making is essentially a physico-capillary and colloidal-chem. process.

A. PAPINEAU-COUTURE

The significance of hydrogen-ion concentration in the manufacture of paper. H. ROSCHIER. *Pappers-Och Travarutidskrift for Finland*, 1927, No. 13, 446-50; *Pulp Paper Mag. Can.* 25, 1165-6(1927).—A discussion of the mechanism of foaming of stock, bringing out the action of alum, gelatin or other colloids on rosin soap and the high foaming properties of sulfite liquor or bleach liquor residues in stock.

A. P.-C.

Pink coloration of esparto papers. JAMES STRACHAN. *World's Paper Trade Rev.* 88, 114(1927); *Paper Mill* 50, No. 35, 34(1927).—The 3 factors in the production of pink coloration of esparto papers are presence of residual ligneous matter in the pulp, partial chlorination of this residue during bleaching, and introduction of S in some form. Though the exact nature of the pink coloring matter is unknown, it is almost certainly an oxidation product of a sulfonated ligneous compd. The following precautions will entirely prevent the trouble: (1) boil the esparto well and evenly; (2) maintain a basic action during bleaching to prevent liberation of HClO or Cl_2 ; (3) do not use antichlors and wash the pulp thoroughly with fresh water after bleaching. When low-soda boiling is adopted to increase the yield of pulp, bleaching and washing should be followed by treatment with 0.5-1% of Na_2CO_3 to destroy the chlorination compds. which may have formed.

A. PAPINEAU-COUTURE

The loading of paper. ANON. *Boll. staz. sper. indust. carta; Papeterie* 49, 201-5(1927).—The tests described lead to the following conclusions: retention decreases with increase in diln. of the stock; addn. of increasing amts. of $\text{Al}_2(\text{SO}_4)_3$ first lowers retention, then increases it to a max., after which it again slowly decreases; retention increases as the acidity due to $\text{Al}_2(\text{SO}_4)_3$ is neutralized and reaches a max. for a pH value of 5.6; when the amt. of $\text{Al}_2(\text{SO}_4)_3$ is increased, the pH being kept const., the retention

first declines, then increases to a max. with about 6-8% $\text{Al}_2(\text{SO}_4)_3$, and finally decreases again; retention is increased by addn. of rosin size (provided the p_H is not lowered below the optimum by addn. of $\text{Al}_2(\text{SO}_4)_3$), by addn. of water glass (especially when used in conjunction with rosin size), by hydration of the stock by beating, by addn. of NH_4OH , and by increase in the size of the particles of filler; addn. of starch soln. does not increase retention; tale gives a higher retention than china clay. A. PAPINEAU-COUTURE

Vegetable parchment. Some curious phenomena. JAMES SCOTT. *Paper Maker and Brit. Paper Trade J.* 74, 155-6 (1927).—A brief description of the prepn. and properties of vegetable parchment or "transparent paper," of the differentiation between vegetable parchments made from cotton and from wood sulfite, and of the microscopical appearance of parchment prepd. by increasingly drastic treatment with H_2SO_4 .

A. PAPINEAU-COUTURE

Effect of atmospheric humidity on the moisture content of paper. T. D. JARRELL. *Paper Trade J.* 85, No. 3, 47-51 (1927).—The amt. of H_2O absorbed and lost by 50 samples of com. papers of different grades exposed successively in air of 35, 50, 65, 80, 65, 50, 35, 50, 65, 80, 65, 50, 35, 65 and 35% relative humidity at 70° F. was detd. The results show that the H_2O content of the paper is appreciably higher at 50 and 65% relative humidity when these conditions are approached from a high humidity (80%) than when approached from a low humidity (35%). Some samples of paper of the same class show a wide difference in H_2O content. Paper contg. groundwood, rope or sulfate pulp contains more H_2O at a given humidity than paper made of all rag, coniferous wood (sulfite), broad leaf wood, or a mixt. of these. News print has a higher and blotting paper a lower H_2O content than any of the other classes of paper tested. Expts. on the rate of absorption and loss of H_2O when paper is transferred from an atm. of 35% relative humidity to one of 65% at 70° F., and then back to 35% humidity showed that H_2O is absorbed more rapidly than it is lost. In general, under the conditions of the expts., 48 hrs. are required for the attainment of equil. when the paper was transferred from 35 to 65% relative humidity, and about 6 days when it was changed from 65 to 35% humidity.

A. PAPINEAU-COUTURE

Expansion of paper with varying humidity. R. C. GRIFFIN. *Paper Trade J.* 85, No. 5, 51-4 (1927); cf. Davis, C. A. 17, 878.—A description of a modified form of the Davis "expansimeter," of the technic of its use, and of the results obtained with it in the examn. of a no. of different grades of papers.

A. PAPINEAU-COUTURE

Constant humidity (paper) testing room. H. T. RUFF. *Paper Trade J.* 85, No. 8, 50-1 (1927).—A detailed description of a small const. humidity and const. temp. room developed in the lab. of the Mead and Pulp and Paper Co., Chillicothe, Ohio, designed to give satisfactory regulation at a moderate cost.

A. PAPINEAU-COUTURE

Manufacture of paper-hangings. CARL HAGBERG. *Industriidningen Norden* 56, 49-53 (1927).—An illustrated review.

C. A. ROBAX

Study of the Mullen paper tester. LEO W. SNYDER. *Paper Trade J.* 85, No. 5, 55-7 (1927).—Comparative tests with new and worn rubber washer clamps and with all-metal clamps showed the latter to be superior. A change from rubber to all-metal clamp will lower the bursting values obtained, while reducing the area of the aperture in the base plate and clamping head will raise the values; and it is suggested that a definite reduction in area be established such that the net result of the 2 changes will be 0.

A. PAPINEAU-COUTURE

Measuring, sampling and testing pulp and paper mill wastes. W. L. STEVENSON. *Paper Trade J.* 85, No. 6, 54-6 (1927).—A description of the various methods of measuring and sampling paper mill effluents, with a brief outline of the analytical technic to be used in testing them and the method of expressing the results.

A. P.-C.

Developments in the Finnish groundwood, pulp and paper industry. ANON. *Papir-Journalen* 15, 143; *Pappers och Travarutidskrift for Finland*, June 15, 1927.—A resumé of the developments of individual companies during 1926.

C. E. P.

Literature review. ANON. *Papir-Journalen* 15, 146 (1927).—A list of 54 recent articles of interest to the pulp and paper industry including Scandinavian, German, American and Canadian publications.

C. E. PETERSON

The moisture equilibrium of egg-case fillers, flats and pads. S. D. WELLS. *Paper Trade J.* 85, No. 14, 56-7 (1927).—The leading points demonstrated in tests reported are as follows: (1) Egg-packing material came to H_2O equil. in an unheated warehouse in a period of about 48 days, only 14 days being required to bring it to 90% of its final H_2O content. (2) Under typical cold storage conditions the time required to come to equil. was only 2 weeks. (3) Approx. twice as much H_2O was held by the material under the cold storage conditions as when at equil. in the unheated warehouse. (4) Lime-cooked straw and spruce groundwood had practically the same H_2O content when

in equil.; Nu-Process stock (Rue and Monsson, *C. A.* **19**, 3591; W., *C. A.* **20**, 2072) contained 3% less. (5) The pack contg. the least H₂O was the combination of cupped flats and Nu-Process fillers; the 1st on account of their low wt. and the 2nd because of their relatively low attraction for H₂O. (6) The H₂O content of this combination at equil. in cold storage was 12 oz. as compared with 15 oz. with white fillers, flats and pads.

High α -cellulose fiber. G. A. RICHTER and M. O. SCHUR. U. S. 1,643,417, Sept. 27. Unbleached sulfite pulp is treated with a soln. of Cl₂ insufficient in quantity to effect complete bleaching, boiled with a suspension of lime, and further boiled with addn. of a soln. of NaOH. Cf. *C. A.* **20**, 3566.

Cellulose acetate and nitrate solutions. J. G. DAVIDSON. U. S. 1,644,417, Oct. 4. Solns. of cellulose acetate adapted for use as lacquers for metals are prepd. with ethylene dichloride, ethylene glycol monoethyl ether and a glycol acetate or other solvent for cellulose acetate having a higher b. p. than the ether used. U. S. 1,644,418 specifies the use of a monoethyl ether of propylene glycol. U. S. 1,644,419 specifies the mixture together of toluene and the monomethyl ether of ethylene glycol. U. S. 1,644,420 specifies a compn. contg. cellulose nitrate and ethyl glycol, suitable for use in lacquer.

Sausage casing of cellulose hydrate, etc. WM. F. HENDERSON. U. S. 1,645,000, Oct. 11.

Dyeing cellulose acetate. I. G. FARBENING A. G. Brit. 262,830, Dec. 14, 1926. Cellulose acetate "silk" is dyed with azo dyes by the development process in the presence of a compd. of the urea group, e. g., in the presence of urea and CH₂O. A full color is obtained with 2,2-hydroxyvinyl-4-aminohydroquinone dimethyl ether developed with diazotized 4-chloro-2-toluidine. Other examples also are given.

Treating sodium sulfite cellulose waste liquor. E. L. RINMAN. Swed. 63,295, June 21, 1927. The waste liquor obtained in boiling cellulose with a soln. of Na₂SO₃ or NaHSO₃ or both is evaporated after sepn. of certain of the substances present in the raw liquor. The residue is burned in such a way that the Na compds. are converted into Na₂S or Na₂S and Na₂CO₃. The residues after the burning are dissolved in water, treated with one or more oxides of metals whose sulfides are insol. in NaOH soln. the Na₂S thus being converted into NaOH. After sepn. from the ppt. the Na₂S soln. is treated with SO₂ for the production of fresh cooking acid. Cf. *C. A.* **21**, 3969.

Charging cellulose digesters. S. SVENSSON. Swed. 63,340, July 12, 1927. A supplement to Swed. 62,160. Aced features.

Pulp. G. A. RICHTER. Can. 274,416, Oct. 4, 1927. Raw cellulosic materials are digested in an acid sulfite cooking liquor in which the free SO₂ and combined SO₂ are in approx. equal proportions of 3-4% each, under conditions of high temp. and pressure. The resultant pulp is sepd. from the spent liquor of digestion and is treated at low temp. with an NaOH soln. contg. a small proportion of bleaching agent. The treated pulp is washed free of its alk. liquor and the entrained products of reaction, and is then bleached. Cf. *C. A.* **21**, 3478.

Refining alkaline pulp. G. A. RICHTER. Can. 274,417, Oct. 4, 1927. Chem.

wood pulp is treated in a liquor contg. bleach and an excess of NaOH for a period of time sufficient to remove the non- α -cellulose constituents but insufficient to effect a substantial mercerization of the α -cellulose content.

Device for drawing off the rosin from the sand-catchers in the cellulose manufacture. A. W. NILSSON and J. BJUR. Swed 62,787, April 13, 1927. Mech. features.

Charging cellulose digesters. S. SVENSSON. Swed 62,460, Feb. 22, 1927. Mech. features.

Device for scattering the chips when charged into cellulose digesters. T. C. OLIN. Swed. 63,252, June 28, 1927. The current of chips passing down into the digester is given a rotary motion.

Blowing the digester contents into the washer. F. I. F. GÖTHNER and E. A. I. BRMELL. Swed. 62,919, May 3, 1927. The so called rising (foaming) of the mass when blown into the washer, caused by the lowered pressure, is avoided by cooling the mass during the transportation from the digester to the washer.

Manufacture of pyrocatechol and other phenols, acids and oils from cellulose waste liquors. K. H. A. MELANDER and J. H. WALLIN. Swed. 62,831, April 27, 1927. Pyrocatechol and other phenols, AcOH and other fatty acids, adipic acid, etc. and oils produced from liquors obtained by boiling wood, straw, etc. with acid or alk. solns. by heating the liquor together with alkali in closed vessels at suitable temp. and pressure. The free oils are partly blown off during the boiling, partly skimmed off the alk. soln. after the boiling has been accomplished. Then the soln. eventually after sepg. mother amt. of oils, methanol, acetone, etc., by distn. is acidified with CO_2 , SO_2 or another acid and after filtration the phenols and org. acids are obtained in known ways.

Celluloid. I. G. FARBERNIND. A. G. Brit. 263,076, Dec. 21, 1925. Celluloid-product such as those obtained as described in Brit. 247,174 (*C. A.* 21, 650) are acid with softening agents such as esters of glycolic, acetic, oxalic and phthalic acids, with hardening agents such as chloral or C_2Cl_6 .

Cellulosic product. M. CUSIN and P. A. A. CHEVALET. Can. 273,733, Sept. 6, 1927. A cellulosic product for the manuf. of artificial textile or plastic substances is obtained by treating cellulose first with HCO_2H and a small percentage of H_2SO_4 , and then treating the product with a mixt. of AcOH and H_2SO_4 in large proportion, both reactions being effected in the cold.

Modification of cellulose for the manufacture of cellulose acetates. M. CUSIN and P. A. A. CHEVALET. Can. 273,732, Sept. 6, 1927. A modified cellulose for the manuf. of cellulose acetates is obtained by treating cellulose with a mixt. of 80% HCO_2H and 20% H_2SO_4 in the cold.

Pulp refining and viscose process. G. A. RICHTER. Can. 273,847, Sept. 13, 1927. The viscose process of treating pulp in the production of viscose consists of soaking purified pulp in a bath contg. a soln. of NaOH, removing the pulp therefrom and expressing excess NaOH soln. therefrom. The raw pulp is purified for such soaking treatment by the expressed NaOH soln.

Apparatus for spinning artificial silk. SOIERIES DE STRASBOURG SOC. ANON and BRONNERT. Brit. 262,874, Sept. 21, 1925.

Paper pulp. C. R. ROBINSON. U. S. 1,644,447, Oct. 4. In order to sep. the fibers from paper pulp, a soln. of Na peroxide is added to the pulp to render it alk. to litmus and the mixt. is heated somewhat above atm. temp.

Paper pulp. H. A. SMITH. U. S. 1,644,451, Oct. 4. Pulp is bleached and jordaned to convert part of its cellulose into cellulose hydrate; the resulting product is passed through a hot starch soln., pressed and dried. This treatment serves to facilitate the production of "grease-proof" papers.

Paper pulp. B. S. SUMMERS. U. S. 1,643,826, Sept. 27. Pulp is formed by digestion with bisulfite liquor contg. H_3PO_4 ; the spent liquor is treated with lime, pptd. as phosphate is sepd. and H_3PO_4 is recovered from it, *e. g.*, by reaction with H_2SO_4 . *C. A.* 20, 3568.

System for drying paper or other materials. J. E. ALEXANDER. U. S. 1,645,366, Nov. 11. Superheated steam of approx. uniform temp. is maintained in a chamber surrounding the material and variable degrees of "conc'n. of heat" are applied to material in the drying chamber which are regulated by elec. heaters.

Opaque markings on transparent paper. K. S. MACLACHLAN. U. S. 1,645,249, Nov. 11. An opaque paper is made on a Fourdrinier machine and rubber or water marks are produced on it while passing through the machine; the paper is then subjected to a super-calendering operation at such a pressure as to render the paper transparent and the markings opaque.

Bleaching paper pulp. OTTO KRESS. U. S. 1,645,061, Oct. 11; Can. 274,563,

Oct. 11. Sulfate or kraft pulp is subjected to the action of a Cl bleaching agent and then to the action of a sulfite. *

Sorting apparatus for paper pulp. J. M. SPANGENBERG. Swed. 62,325, Feb. 1, 1927.

Suction box for paper machines. F. E. BERRY. U. S. 1,644,867, Oct. 11.

Insulating paper. H. FRIEDLÄNDER. Brit. 262,828, Dec. 14, 1925. In making pliable, waterproof paper or millboard or the like, hard waxy substances are added to the pulp in the beating engine or edge runner mill. Montan wax, carnauba wax and coumarone resin may be used together. Resin sizes, fillers and artificial phenol resins also may be used.

Paper-making apparatus. R. E. HEISEL. U. S. 1,643,657, Sept. 27.

Paper-making apparatus. C. W. UNKLE. U. S. 1,644,620, Oct. 4.

Portable air nozzle for paper-making apparatus. FRANK BEDARD. U. S. 1,644,226, Oct. 4.

System for continuous feeding and mixing of paper pulp or like material with bleaching agents. C. B. THORNE. U. S. 1,643,566, Sept. 27.

Self-supporting lining for Jordan-engine shells. A. L. BOLTON. U. S. 1,643,368, Sept. 27.

24 - EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Report of the Chief Inspector of Explosives of Victoria for 1926. REG. J. LEWIS. *Pamphlet* 10 pp. Melbourne, Australia, 1927; cf. C. A. 20, 3570.—The chief explosives manufd. and imported are of the gelatin dynamite class. All black powder, blasting as well as sporting, is imported and constitutes about $\frac{1}{4}$ of the total. As 10 licenses were issued to manuf. Rack-a-rock and Lithyte, explosives which are made at the firing ground as wished for use, the proportion of black powder is probably less than above stated. It appears that in Australia, as elsewhere, black powder, which was practically the only explosive in use for over 500 years, is rapidly being displaced by modern explosives. All of the 11 accidents recorded were of a minor character, most of them occurring in the "bullying" with gelignite. This process, known in this country as "springing" or "chambering," consists in detonating small charges of a high explosive in a bore-hole through which to enlarge the cavity at its lower end, which is then filled with the charge for the final blast. Accidents occur from this last charge as it is being fed into the borehole becoming ignited by incandescent or heated particles of the "bullying" charge left in the cavity.

CHARLES E. MUNROE

Tritol (trinitrotoluene) as an explosive. R. GIOVETTI. *Notiz. chim.-ind.* 430-2(1927); cf. C. A. 21, 3129.—Descriptive information and data of importance with diagrams and illustrations.

C. C. DAVIS

Hydrogen peroxide explosives. M. BAMBERGER AND J. NUSZBAUM. *Z. ges. Schiess-Sprengstoffw.* 22, 125-8(1927).—Mixts. of H_2O_2 (60% soln.) with powd. *para* formaldehyde are brisant explosives which detonate on heating or under the influence of a blasting cap. The mixt. also detonates spontaneously when left for a short time in contact with Pb, presumably from evolution of heat from oxidation of the Pb. Crystals, m. 50° , were sepd. from the mixt. and found to have a high degree of sensitiveness and brisance. Forty g. cellulose (either cotton or wood pulp), treated with 200 g. of 83.4% H_2O_2 , forms a viscous, gelatinous mass, 10 g. of which was detonated in a Trauzl Pb block with a No. 8 cap, giving a net expansion of 408-414 cc., as compared with expansions of 390-400 cc. for tetranitroaniline, 320-340 cc. for dynamite, and 245 cc. for TNT. The new explosive burns without detonation when dropped in a red hot crucible or ignited by flame, is relatively insensitive to friction or shock, and has an ignition temp. of $194-208^\circ$. It must be prepd. shortly before use, as bubbles resulting from decompn. of the H_2O_2 are evolved on standing, and the mass hardens. After 48 hrs. the Trauzl test dropped to 349-371 cc. Data given concerning actual blasting trials in rock indicate very satisfactory performance in both drill hole and mud-capped shots.

C. G. STORM

New possibilities in the production of nitroglycerin. ARNOLD SCHMID. *Z. ges. Schiess-Sprengstoffw.* 22, 169-73, 201-6(1927).—An app. and method for the continuous nitration, sepn. and washing of nitroglycerin are described, with illustrations.

C. G. STORM

Quantitative stability tests of smokeless powder. J. C. A. SIMON THOMAS. *Z. angew. Chem.* 40, 991-2(1927).—Four g. of powder, ground to pass 0.5-mm. mesh, are

ated in a glass-stoppered glass tube 160 mm. long and 18 mm. internal diam. in an l bath held at 104–6° for double base, at 109–11° for single base smokeless powder. he glass tubes are first heated open for 8 hrs. to drive out H₂O and volatiles. Good nokless powders should not lose more than 2% in wt. during the first 8 hrs. Various mples were also heated continuously for 5 days. Tables show that double base powders ithout stabilizers do not stand up, also that a small addn. of vaseline does not suffice t a small addn. of dimethyldiphenylurea (centrallit) or NaHCO₃ is sufficient to make e powder stand the test. Larger amts. of vaseline produce powders just as stable e those with centrallit, although no chem. but merely a phys. stabilizing action must e assumed with vaseline in that it closes the pores of the powder and prevents access H₂O and air. A stable single base powder can be produced from good raw materials d without stabilizer, but small quantities of diphenylamine are desirable.

H. M. SYMMES

Inflammability of hydrogen. IV. Influence of dimethyl selenide and dimethyl lluride on the limits of inflammability of hydrogen-air mixtures. YOSHIO TANAKA ND YŌZABURŌ NAGAI. *Proc. Imp. Acad. (Japan)* 3, 348–51 (1927); cf. *C. A.* 21, 3130.— y the addn. of about 1% of either Me₂Se or Me₂Te, the upper limit of inflammability f H is lowered from 71 to about 43; further addn. causes a more gradual decrease. e₂Se, Me₂Se and Et₂Se all have the same theoretical flame-propagation temp., 1750°.

Influence of tetramethyl tin and tetramethyl lead on the limits of inflammability f hydrogen-air mixtures. *Ibid* 434–6.—The upper limit of H is lowered from 71 to 4% by the addn. of 0.125 mol. % of Me₄Sn; further addn. gradually lowers it, until mol. % gives a value of 38.5%; 0.50 mol. % of Me₄Pb lowers the upper limit from 1 to 54, but further addn. raises the upper limit, 2.50 mol. % giving a value of 59%. he lower limit of H is little influenced by the addn. of 0.5% of Me₄Sn or Me₄Pb, but further addn. decreases the lower limit. The theoretical flame-propagation temp. f Me₄Sn and Me₄Pb is 1680°.

C. J. WEST

Some factors influencing the ignition of carbon monoxide and oxygen. A. K. BREWER. *Proc. Nat. Acad. Sci.* 13, 689–94 (1927).—By the use of inductances to vary he peak c. d. in the circuit of a heavy condensed discharge igniting an explosive mixt.

CO and O, it was found that the mechanism of the ignition at a const. pressure as independent of any particular stage of ionization produced in the spark. This as true for moist and dry gases. Ignition at const. pressure is dependent upon the nergy of the spark, and not upon voltage, but ignition points at varying pressures epend upon voltage. Addn. of water vapor lowers the ignition voltage. A, N, O₂, EtOH, Et₂O, CHCl₃ and isopropyl nitrite, being inert in the explosion except as they bsorb energy, increase the ignition potential. H, CS₂, EtOH and Et₂O are themselves xidized in the explosion, and lower the ignition potential. The combustible vapors ise the ignition voltage unless enough O is present to burn them.

R. J. H.

Least energy required to ignite the mixture of air and the vapors of ethyl ether. ZABURŌ NAGAI AND MINAO FURIHATA. *Proc. Imp. Acad. (Japan)* 3, 352–4 (1927).— e least energy required to ignite mixts. of air contg. from 2.50 to 6.65% Et₂O at 100, 1 and 200 v. is reported in a table and as curves. This energy (at 100 v.) decreases idly for Et₂O concns. of 2.5 to 3.9%, remains const. from 3.9 to 4.7%, increases denly at 4.8%, remains const. from 5 to 5.9% and then increases again. When voltage of the condensers is raised, the concn. range of the 1st horizontal stage xtended on both sides, resulting in the narrowing of the range of the 2nd horizontal ge, until finally the latter stage vanishes when the condensers are charged up to 1 v. When the pressure is reduced, the least energy for ignition is increased.

C. J. WEST

Effect of ethyl bromide on the least energy required to ignite the mixtures of air i the vapors of ethyl ether. Y. NAGAI AND M. FURIHATA. *Proc. Imp. Acad. (Japan)* 355–60 (1927).—The least energy for ignition increases with the amt. of EtBr added, ept for the mixts. poorer in Et₂O, for which the least energy decreases owing to the ring of the lower limit of inflammability.

C. J. WEST

Innovations in the methods of blasting with liquid air. HEYER. *Kali* 21, 237–40 (27).—Recent economical developments in the mining of rock salts with liquid cartridges are outlined. Illustrations of equipment are given.

D. THUSEN

Factors which influence the quality of safety fuse. FRANJO KOBEVAR. *Z. ges. heiss-Sprengstoffw.* 22, 93–5, 139–41 (1927).—The chief factors governing the unity in rate of burning were found by many tests to be the compn. and quality of the ck powder, conditions and time of storage, quality of jute and method of spinning, iency of impregnation with asphaltum, and atm. influences. Increasing the KNO₃ tent of the powder increased the rate of burning, while addn. of graphite causes

an opposite effect, as does also increase in moisture content or in d. of the powder.

C. G. STORM

Explosions caused by oil vapor. EDWARD INGHAM. *Power* **66**, 400(1927).—Such explosions may occur in crank cases as a result of over-heating at the cross-head guides. The liability to these accidents can be reduced by use of suitable oils and by restricting the quantity of lubricant to a min.

D. B. DILL

Cordite factory explosion. ANON. *Chem. Age* (London) **17**, 255(1927).—This explosion, which killed 3, occurred Sept. 10, 1927, in a stove of the Me₂CO recovery plant of the Royal Naval Cordite Factory, Holton Heath, Dorset, while workmen were dismantling the plant and as the last joint of the coil for carrying off the Me₂CO was being unscrewed. Although the temp. of the stove is kept down to 45° to avoid nitroglycerin evapn., some does volatilize and condense in the pipes. As the pipe had sagged at this joint it is believed nitroglycerin collected there and was exploded by friction as an attempt was made to unscrew the joint.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

New dyes derived from acenaphthene. T. J. TAPPEY. *Textile Colorist* **49**, 521-5 (1927).—Attempts to condense *acenaphthenequinone* (I) with 2,3-diaminoanthraquinone (II) by glacial AcOH or H₂SO₄ were not successful. The condensation of I with 3-aminoanthraquinone by means of AcOH and NaOAc, AcOH and Zn dust, EtOH, Zn-Cl₂, or anhyd. AlCl₃, also all failed. Condensation of *naphthalic anhydride* (III) with II in glacial AcOH gave a brown vat dyestuff (IV). Nitration of IV gave a red vat dyestuff of good fastness to Cl. On condensing 1 mol. of III with 2 mols. of resorcinol a yellowish brown acid dyestuff (VI) is formed. Bromination of VI gave a magenta acid dyestuff (VII). Nitration of VI gave a seal-brown acid dyestuff (VIII). Reduction of VIII gave a greenish black acid dyestuff. Condensation of 1 mol. of I with 2 mols. of resorcinol gave a tan acid dyestuff (IX). The bromination product of IX is similar to VII but duller. VI appears to be faster to light than fluoresce. When VI is coupled to sulfanilic acid an olive dyestuff results. By using III in place of the usual phthalic anhydride, as in the prepn. of fluoresce, fluorescent dyestuffs were produced. A dyestuff resembling Violamine B was produced from VI. Fusion of *naphthalimide* with KOH gave a pink vat dyestuff (V). On treating V with concd. HNO₃ a green acid dyestuff results, probably by oxidation.

CHAS. E. MULLIN

The method of production of blue hydrone dyes. E. ORLOV AND M. KACHURIN. *J. Chim. Ukraine* **2**, *Tech. Teil* 65-73; *Chem. Zentr.* **1926**, II, 2634-5.—By following the patent directions, several hydrone dyes were synthesized; the conditions of prepn. and the dyeing properties are described. In conclusion the analysis of Na₂S according to the method of Podreschetnikov is surveyed. Its basic reactions are: Na₂S + H₂O → NaOH + NaSH and NaSH + HCHO + H₂O → NaOH + HOCH₂SH. The NaOH formed in both stages is titrated with HCl to phenolphthalein.

C. C. DAVIS

Yellow dye from the wood of Cochlospermum. C. D. MELL. *Textile Colorist* **49**, 555-6(1927).

L. W. R.

A study of certain amino derivatives of acridine and some related compounds. SAMUEL MEEKER. *Textile Colorist* **49**, 447-51(1927).—In a study of the influence of acridine and some related compds. upon the color and properties of azo and other

dyestuffs *m*-, *o*- and *p*-nitrobenzoic acids and acridyl benzoic acid (I) were prepd. By suitable steps I was converted into the amino compd. (II) and coupled in alk. soln. with various components. The compd. of II with II acid is sol. and when applied as an acid dyestuff gives a pure purple color. The chromotrope acid compd. forms a reddish brown soln. which cannot be used as an acid or basic dye. With Neville-Winther salt II gives a sol. green acid dyestuff. The Schaeffer salt compd. gives a strongly fluorescent blue to yellow soln. which acts very slightly as an acid dye. The R salt compd. gives a blue to yellow soln. but is not suitable as an acid or basic dyestuff. The croceine salt compd., while sol., is not suitable as a dyestuff. With F salt II gives a greenish brown soln. sensitive to acids, only slight dyeing action. With J acid II gives an insol. blue compd. The 1-amino-8-naphthol-2,4-disulfonic acid compd. is sol., giving a strongly fluorescent red to brown soln., and in an acid bath dyes a light brown color. The 1-naphthol-3,8-disulfonic acid compd. with II is a sol. red or brown fluorescent salt which is almost decolorized by the addn. of acid. It dyes wool a light cream color. The 1-naphthol-3,6,8 trisulfonic acid compd. gives a red to brown fluorescent soln. The naphthol BS compd. is insol. CHAS. F. MULLIN

The oxidation of organic dyestuffs and cellulose under the influence of light. W. SCHARWIN AND A. PAKSCHWER. *Z. angew. Chem.* 40, 1008 10(1927).—Different org. dyestuffs on cotton or paper were sealed in glass tubes with the gases O_2 , NO , N_2O , CO , CO_2 , H_2 or N_2 and exposed to sunlight or to light from a quartz Hg lamp. The speed of bleaching decreased in the order of the gases named. None was observed in the tube with N_2 and generally none with H_2 , although in the latter case, very decided changes, due to reduction, sometimes took place. On exposure to moist air, the reaction was reversible. The changes due to oxidation were of course not reversible. In those tubes contg. O_2 , NO or N_2O , CO_2 was always present in the gases after exposure to sunlight. The work was interrupted at this point by the war. It was resumed on a much larger scale. The investigation was extended to more substrates, such as pieces of porous clay plate, in addn. to cellulose. Ten g. samples were used, and the amt. of dye applied was detd. Each sample was sealed in a special tube with pure dry O_2 and exposed to sunlight for 4 months. The CO_2 in the gas was detd. with $Ba(OH)_2$. In every case, CO_2 was found. It was surprising to note that in those cases where cotton was the substrate, the quantity of CO_2 was much greater than with the clay substrate. Undyed cotton exposed under the same conditions showed the presence of considerable CO_2 . Filter paper and cellulose sealed in tubes contg. O_2 and exposed to the quartz Hg lamp at a distance of 40 cm. for 3 hrs. also showed the presence of CO_2 . The CO_2 in the tubes with the cotton substrate therefore has 2 origins, the oxidation of the dyestuff and, probably more important, the oxidation of the cellulose. After exposure, the fiber was found to have lost a considerable part of its tensile strength, the undyed material more than the dyed, and to show the reactions attributed to oxycellulose. Other carbohydrates, including starch and sugar, were exposed for 3 hrs. and a positive test for CO_2 was obtained. The work is being continued. RUBY K. WORNER

Notes on the indigosols. F. PETERHAUSER. *J. Soc. Dyers Colorists* 43, 251-3 (1927).—Lists of dyes and methods of their use are given. L. W. RIGGS

Indigosol colors in cotton piece dyeing. D. S. NAVLOR. *Dyer, Calico Printer* 58, 32-3(1927).—Several formulas are given and the application of these dyestuffs is discussed. The indigosols do not dye dead cotton. C. E. MULLIN

Formulas for 1927 fall shades on chrome-tanned side leather. *Woolen Dyestuffs* 28, 76-7(1927). CHAS. E. MULLIN

The theory of dyeing processes. LIGON RUD. *Festschrift 100-jähr Besteh. Tech. Hochschule Karlsruhe* 1925, 490-6; *Chem. Zentr.* 1926, II, 2632-3, cf. *C. A.* 20, 3574.—From the point of view that both phys. and chem. processes play a mutually important role in dyeing, the dyeing of wool with acid and basic dyes was investigated. Special attention was directed to the part played by the p_H value of the bath during the dyeing. The action of crystal violet on wool results in an increase in the p_H value of the bath after the dyeing, because of liberation of H ions from the wool into the soln. This independent of the concn. of the dye or of the quantity of the dye taken up by the wool. The initial value of p_H depends upon the initial concn. of the dye, while the final value of p_H is independent of both the concn. of the dye and of the quantity of wool. Contrary to the data of Briggs and Bull (*C. A.* 17, 1149), the quantity of dye taken up from soln. by the wool does not depend directly upon the p_H value of the bath. With acid dyes the alk. of the bath is greater after the dyeing, but here too there is no relation with the quantity of dye absorbed. Measurements of p_H during the action of acid and of alkali solns. on the same kind of wool showed that wool absorbs H ions from solns. which are more acid than p_H 4.6, whereas the wool liberates H ions in solns. having a

p_H value over 4.6, with accompanying decompn. of the wool substance. At p_H 4.6 the H-ion concn. does not change on account of reactions between the wool and the soln., and at this p_H the wool is not decompd. The analogy between this phenomenon and the behavior of amphoteric electrolytes at the isoelec. point allows the assumption that the value p_H 4.6 is a mean value for the isoelec. points of the several amphoteric substances comprising the wool substance of the particular grades of wool examd. In any case the wool with its wool substance takes an active part in the dyeing process and does not behave as an adsorbent in the classic meaning of the term, which involves reversibility, and therefore a purely phys. conception of the dyeing process appears to be inadequate. C. C. DAVIS

Delustering rayon. K. M. HERSTEIN. *Rayon J.* 2, No. 4, 13-4, 45; *Silk J.* 4, No. 37, 60—A discussion of the delustering of acetate and the other rayons. The older rayons are usually delustered with Al soaps or BaSO₄, but the use of chloroacetic acid or pectin has been suggested. CHAS. E. MULLIN

Treating rayon for knitting. R. P. MORNINGSTAR. *Rayon J.* 2, No. 4, 30-1, 46 (1927).—Lubrication of the fibers is described. CHAS. E. MULLIN

Chitin and chitin silk. G. KUNIKE. *Kunstseide* 8, 182 3; *Chem. Zentr.* 1926, II, 2129.—The chem. behavior of chitin is discussed. If purified chitin is dissolved in acids, a thread can be spun wet or dry, which has a round or heart-shaped cross-section and a tensile strength of 35 kg. per sq. mm., whereas the tensile strength of cellulose silk is only 25 kg. per sq. mm. In appearance the pale lustrous threads resemble acetate silk and real silk. Films of chitin of large size are also transparent and show high resistance to creasing. The production of material for the chitin goods offers no difficulties. C. C. DAVIS

The chemical analysis of cotton. The effect of the disruption of the cotton hair on the extraction of fat, wax and resin. R. G. FARGHER AND LUCY HIGGINBOTHAM. *J. Text. Inst.* 18, 283-7T(1927); cf. *C. A.* 18, 1753.—The effect of destroying the structure of the material is to facilitate the extn. of substances which are otherwise removed slowly and not to make accessible substances protected from attack by their position within the hair (cf. *C. A.* 17, 2507-8). The effect is considerably smaller than indicated by Knecht and Street. Since treatment with acids prior to extn. causes loss of part of the fatty material, a single extn. is impracticable. Extn. of the gray or gray-soured cotton and then of the tendered material gives a total ext. equal to that obtained by triple extn. by Knecht and Street. RUBY K. WORNER

Effect of light on colored cotton fabric. I. EVA HIBBERT. *J. Soc. Dyers Colorists* 43, 292-4(1927).—Expts. showed that the destruction of color in calico dyed with direct colors occurred quite independently of any reducing action by cellulose in the presence of light. It is possible to obtain isatin from indigo-dyed cotton by oxidizing the color on the fiber with KMnO₄ in 7.5% H₂SO₄. It is shown that the destruction of indigo on cotton by the action of light is due to the oxidation of the color to isatin. L. W. RIGGS

Mechanical air equipment for coloring textiles. WM. BREWSTER. *Textile Colorist* 49, 545-7(1927).—Spraying app. are described. CHAS. E. MULLIN

Action of sodium perborate on cotton and linen cellulose in the presence of catalyzers. Y. DALSTRÖM. *Svensk Kem. Tid.* 39, 141-56(1927).—German summary. The stabilizing effect of Na₂SiO₃ on perborate is apparent, not real; it does not appear in distd. water. The catalytic action of Cu salts is not as inorg. Cu but in some org. combination with cellulose. The action of Cu on the cellulose → oxycellulose in perborate solns. is effectively inhibited by Na soaps when Na soap : perborate = 1:1 for linen and 1:3 to 1:5 for cotton. If the perborate concn. in laundry fluids is such that the solns. are never satd. at 97° the O₂ will confine its action to bleaching the fabric. Part of this article is polemic. A. R. ROSE

The role of moisture in the absorption and hydrolytic action of acids in non-aqueous solvents on cotton. I. **Hydrogen Chloride in toluene.** F. C. WOOD AND ERNEST BUTTERWORTH. *J. Soc. Chem. Ind.* **46**, 375 ST(1927). The action of concns. of HCl between 0.1 and 0.6% in anhyd. toluene on scoured or gray cotton yarn contg. various amts. of moisture is described. The absorption of HCl from toluene by cotton is practically complete after 10 min. at 25°. The amt. is dependent upon the water content of the cotton. For concns. below 28%, HCl, the tendering is dependent upon the concn. of the aq. acid and not on the proportion present, but in 28% HCl solns., it is dependent upon the ratio of cotton to sat'd. aq. soln. In no case was phys. alteration in the direction of parchmentization or dissolution effects observed. The tendering was greater with the scoured yarn. RUBY K. WORNER.

Experimental yarn-sizing plant and some results obtained with it. G. B. NEW. *J. Textile Inst.* **18**, 301-19T(1927). An apparatus specially constructed for the prepn. of sizes and their application to the yarn is described. It consists of a water jacketed boiler and a small scale sizing machine, so constructed that all variables can be regulated. The effects of the concn. of starch, its nature, amount, and temp. of cooking, and of the addn. of fats, waxes, oils, etc., were studied. The concn. of starch gives a proportional increase in the protective power in most cases. Above a certain temp. starches expand, was found, above which starches do not expand. Above a certain temp. limit, specific for each starch and well below 100° C., temp. has no appreciable effect. The time factor is also measurable within the range of 1 hour to 6 hrs. In this work, a standard temp. of 100° and standard time of 1 hr. were generally adopted. With the exception of glycerol which increases the protective power, a film of various fats and oils to the size decreases its protective power. HCl, however, the fats and oils are applied to the surface of the yarn after it has been sized and dried, the wear-resisting power is improved. Of the materials examined, paraffin wax and stearin were the most powerful protective agents. RUBY K. WORNER.

Introduction to a study of wool. CHAS. E. MULLIN. *Can. Colorist Textile Processors* **7**, 230, 238(1927). Introduction to a study of wools upon the constitution of wool. CHAS. E. MULLIN.

Synthetic resins and their application to textile materials. A. J. HALL. *Dye Calico Printer* **58**, 6-7(1927). At present does not find very little use in the textile industry but it is possible that in the fut. they may find use in finishing, resisting and printing textiles. CHAS. E. MULLIN.

After-treatments of cotton yarn and fabric. T. H. HARRIS. *Textile Colorist* **49**, 471 2(1927). Sizing and finishing materials are considered. C. E. M.

Stencilling. HARRY WATSON. *Textile Colorist* **49**, 396-7, 468-9(1927). A general discussion of stencilling as applied to textile materials. CHAS. E. MULLIN.

The relation between tanning agents and vegetable dyes (FREUDENBERG) 26. Production of photographic images on cellulose acetate film (HALL, HILL) 5. A photographic method of investigating the color of light sources, and the reflecting power of colored fabric (CUNLIFFE, FARROW) 2. Detergent action of soaps (VINCENT) 27. Determining Cu in chemically treated cloth (BONNARD, LIBMAN) 7. Halochromism and deep colored ketones (WIZINGER) 10.

Dyes. T. G. FARENHED. A-G. *Brit.* 262,819, Dec. 11, 1925. Dibenzanthrone dyes are obtained by treating *h,h'*-dibenzanthronyls with alk. condensing or reducing agents. Several examples are given for the production of dyes giving blue and red-violet shades on cotton from the vat. The starting materials can be obtained by treating halobenzanthrone with metal powders or by boiling diazobenzanthrones in the presence of Cu_2Cl_2 , or by oxidizing benzanthrone in acid soln.

Dye. H. WAGNER and A. FUNK. U. S. 1,611,003, Oct. 4. A greenish yellow monoazo dye is formed from diazotized 4-chloro-2-nitroaniline and acetoacetic chloroanilide.

Isodibenzanthrones. PAUL NAWIASKY, OTTO BRAUNSDORF and EDUARD H. ZAPFEL. U. S. 1,644,819, Oct. 11. By heating 2-methoxy-3,3'-benzanthracenyl sulfide with a mixt. of caustic alkali and alk. a dye of the isodibenzanthrone series is obtained which dyes from a pure blue vat pure bluish violet shades.

Isodibenzanthrones. HEINRICH NERESHEIMER. U. S. 1,644,850, Oct. 11. About equimol. proportions of benzanthrone-3-thio-*p*-cresyl ether or other benzanthrone-3-thio ether having a free 2 position and a benzanthrone having free 2- and 3-positions such as benzanthrone or 6-chlorobenzanthrone are heated with Na and alk. or other alk. condensing agent in the absence of O.

7-Keto-7-meso-benzanthrone-3-sulfinic acid. HEINRICH NERESHEIMER and HANS EMMER. U. S. 1,644,851, Oct. 11. 3-Chloro-7-meso-benzanthrone in MeOH is treated with aq. NH_3 and Na hyposulfite and the product after distn. of the MeOH dissolved in hot H_2O (with aeration) and acidulated. Other similar reactions are described.

Indigo. D. G. ROGERS. U. S. 1,644,493, Oct. 4. In production of indigo by the caustic fusion of indigo-yielding substances, the fusion is carried out with the addn. to the reaction mixt. of kerosene oil b. above 240° or other petroleum hydrocarbon material which is liquid at ordinary temps. and serves to reduce the quantity of alkali required.

Apparatus for piece dyeing. T. J. BACHOFEN. U. S. 1,644,460, Oct. 4.

Piece dyeing. T. J. BACHOFEN. U. S. 1,644,461, Oct. 4. Shrinkage is controlled by winding the goods in spaced layers and maintaining them in stretched and wound condition while the wound goods as a unit are subjected to operations such as boiling, bleaching, dyeing and drying.

Apparatus for piece dyeing. T. J. BACHOFEN. U. S. 1,644,462, Oct. 4.

Dyeing silk. I. G. FARBENIND. A.-G. Brit. 263,088, Dec. 21, 1925. Silk is dyed with mixts. of vat and azo dyes by impregnating with a 2,3-hydroxynaphthoic amide or a compd. contg. a reactive CH_2 group, together with a vat dye which has been dissolved by a usual method; the vat dye is then oxidized in insol. form and the azo dye is formed by treatment with a diazo component. Raw silk can be degummed either during or after the dyeing process. Examples are given. Cf. C. A. 21, 2565.

Apparatus for dyeing yarn, etc. BRITISH COTTON & WOOL DYERS ASSOCIATION, LTD., E. A. BARKER and F. ELLISON. Brit. 262,909, Nov. 21, 1925.

Color prints by the dye transfer process. R. VON ARX. U. S. 1,643,529, Sept. 27. Most mordant dye images are used for printing purposes in intimate contact with copy sheets or layers such as collodion which have greater affinity for the dye used than that of the material of the mordant printing images.

Acid sulfuric acid ester compounds of aromatic hydroxyalkyl ethers. W. HENTRICH and M. HARTTMANN. U. S. 1,644,524, Oct. 4. The K salt of the acid H_2SO_4 ester of 3-nitromethylbenzene-4-ethylene glycol ether or other compds. of the probable general formula, $\text{aryl-O-aryl-O-SO}_2\text{-OX}$, in which X stands for H or a salt-forming basic residue and which are dye intermediates, are formed by processes including treating aromatic hydroxyalkyl ethers with concd. H_2SO_4 at room temp.

Dye pole (with steel tube and hard rubber jacket) for drying artificial silk, yarn, etc. E. S. TEED. U. S. 1,643,594, Sept. 27.

Degumming silk. I. ZO WALLERSTEIN. U. S. 1,644,764, Oct. 11. Silk is subjected to the action of papain or other proteolytic enzymes of the type which is active in a neutral or in a slightly alk. or slightly acid medium, at a temp. not less than 50° .

Printing textile fabrics. I. G. FARBENIND. A.-G. Brit. 262,987, Feb. 11, 1926. Fabrics are printed with a mixt. of an alkali salt of a coupling component suitable for producing azo dyes on the fiber and a salt of an aromatic sulfo-nitrosaminic acid. On treatment with an acid, azo dyes are developed on the fiber. Numerous details and examples are given. Aromatic sulfamic acids are obtained by condensing aromatic amino compds. with aminosulfonic acid. Aromatic sulfo-nitrosaminic acid salts are obtained by treating aromatic sulfamic acid salts with nitrite and acid and neutralizing with caustic alkali.

Protecting textile materials from chemical action and increasing their strength. A. MEYER-SANSBOEUF GES. Brit. 263,102, Dec. 21, 1925. Materials such as cotton, artificial silk, flax, hemp or jute are protected from the action of substances which destroy cellulose and their strength is increased by treatment with 3 successive baths having a tanning, mordanting and oiling action, resp. Several examples are given.

Sizing composition for textile yarns and threads. C. F. RILEY and G. A. AW-COOL. Can. 274,638, Oct. 11, 1927. A sizing compn. consists of a salt of a resinous acid, a fatty lubricating agent and a soap of a fatty acid. Can. pat. No. 274,639 specifies a sizing compn. consisting of a preponderating quantity of resin and subordinate quantities of a fatty lubricating agent and a soap of a fatty acid.

Testing strength of fibers. E. E. CHANDLER. U. S. 1,643,333, Sept. 27. Fibers such as cotton are arranged parallel to each other, wrapped with a thread to obtain the superficial area of the bundle and to prep. it for an even break, and the bundle is then broken to det. its strength.

Moth-proofing fabrics. L. E. JACKSON and H. E. WASSELL. Brit. 263,092, Dec. 17, 1925. Woolen fabrics, furs, feathers, etc., are treated with a soln. of a cinchon alkaloid or a salt of such an alkaloid, e. g., with a naphtha soln. of quinine oleate which may be used for dry-cleaning.

Apparatus for preparing fibers of ramie or other materials for spinning. J. DE-LENS, I. SOF and A. NICHOLAS. *Bril.* 262,815, Dec. 12, 1925.
Fulling mill. R. J. WILSON. U. S. 1,645,210, Oct. 11.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Determining the covering capacity of paints. V. V. KOLCHEV. *Trans. Russ. Inst. Applied Chem.* 1925, No. 4, 27-33.—A comparative study of glass and metal as objects for the detn. of the covering capacity of paints. Glass is more suitable for this purpose, as the absorption of light is more easily detd. J. S. JOFFE

Casein as binding medium for pigments. E. O. RASSER. *Kunststoffe* 17, 197-8 (1927).—The prepn. of paints with casein solns. as binding medium for the pigments is described. When properly prepd. such paint possesses an enormous binding power, the colors obtain the highest luminosity, the keeping quality is unlimited and it is most convenient and cheap in use D. THUSEN

Examination of water-line (marine) paints. M. RAGG. *Farben-Ztg.* 31, 1795-8 (1926); cf. Figg, C. A. 20, 994.—R. discusses the results of Figg's expts. on boot-topping paints applied on iron objects and exposed at the water line. J. SCHALCH

The chemistry of satin white. P. FUCHS. *Chem.-Ztg.* 50, 769-70 (1926).—Satin white is a mixt. of gypsum and Ca aluminate (5/2) with small quantities of $\text{Ca}(\text{OH})_2$. It is formed by the action of $\text{Ca}(\text{OH})_2$ on the basic Al sulfate of the formula $[\text{Al}_2(\text{OH})_2(\text{SO}_4)_2, \text{Al}(\text{SO}_4)_3]$, which contains 80-85% of the H_2SO_4 necessary to form the neutral salt. The reaction proceeds in two steps, which are characterized by the viscosity of the reaction mass: formation of gypsum, product little viscous; formation of Ca aluminate, product very viscous. An explanation for the failure to obtain a satin white of suitable consistency by using the neutral Al sulfate instead of the basic product is that in the first case 6 mols. CaSO_4 and no H_2O , in the latter only 5 mols. CaSO_4 and one mol. H_2O per 2 mols. Ca aluminate are formed. The high CaSO_4 content and the absence of reaction H_2O are chiefly responsible for the failure in making satin white of a suitable consistency from neutral Al sulfate. J. SCHALCH

Testing methods for turpentine, used in the chemical industry. G. AUSTERWEIL. *Chem.-Ztg.* 51, 249-51 (1927).—For the manuf. of camphor and perfumes genuine turpentine oil is used which should satisfy the following tests. Absence of water. Turpentine mixed with 2-3 parts benzene should not become turbid. Acidity: The acid number, detd. in the usual way, should be below one. Carbohydrates: Tests for carbohydrates should be negative. Test for α - and β -pinene: $[\alpha]$ should not be higher than $\alpha/D \pm 39^\circ 50'$ which is the value for $[\alpha]$ of α -pinene. Inactive or β -pinene, having half the rotating power of α -pinene, lowers the above figure. Distn.: About 500 g. of turpentine, dried for 24 hrs. over anhyd. Na_2SO_4 , is distd. in an app. consisting of a one-l. flask, charged with Ca filings or china splinters, and a Lebel-Henninger five-bulb or a Vigreux column, 35 cm. long. Five fractions of 100 cc. are collected which should distil between 153.5° and 165° at 760 mm. and should amount to 90% of the total. The sp. grs. of the fractions should lie between 0.862 and 0.874 and n between 1.4625 and 1.4755. The residue, amounting to 10%, is steam-distd. The distillate should show within a limit of 10% the same $[\alpha]$ as the original turpentine oil. J. S.

Collection of crude turpentine and resin in the Landes department of France. K. MARY HUTCHIN. *Pharm. J.* 119, 245-7 (1927); cf. Lendner, C. A. 21, 2071.—A descriptive account, illustrated by photographs. S. WALDBOTT

Lead poisoning in an enameling plant. W. S. LEATHERS and HUGH J. MORGAN. *J. Am. Med. Assoc.* 89, 1107-12 (1927). L. W. RIGGS

"Anime" resin, and constitution of so-called copal. HERMANN KUNZ-KRAUSE. *Pharm. Ztg.* 72, 1124-5, 1142-3 (1927).—A discussion of the terms and products. W. O. E.

Lake making (MATOS) 25. Synthetic resins and their application to textile materials (HALL) 25. Analysis of lithopone (REMINGTON) 7. Separating crude shellac solutions or other liquids from suspended matter centrifugally (U. S. pat. 1,644,492) 13. Cellulose acetate and nitrate solutions (U. S. pat. 1,644,420) 23.

Paint finishes. C. H. EGGLEHOFF. U. S. reissue 16,760, Oct. 4. See original pat. 1,600,723; C. A. 20, 3580.

Titanium pigment. L. E. BARTON and L. W. RYAN. Can. 274,070, Sept. 20, 1927. A concd. aq. suspension of CaSO_4 is added to a Ti soln. and the charge boiled to pptn. of the Ti. The soln. is filtered to sep. the ppts., which are calcined.

Reflecting metal coatings. LAMPEN- UND METALLWAREN-FABRIKEN R. DITMAR GEB. BRUNNER AKT.-GES. Brit. 262,827, Dec. 14, 1925. Flexible backing material is impregnated with a binder such as resin, shellac, celluloid or gum which softens under heat when applied by pressure to the foundation plate to which the metal coating has first been applied. The surface of a celluloid backing may be made viscous by glacial HOAc and a metallic coating united with the viscous surface by heated rollers. Electrolytic coatings also may be used.

Dissolving and bleaching shellac. F. C. RAWOLLE. U. S. 1,644,491, Oct. 4. Lumps of plastic crude shellac are treated with a continuous flow of a dissolving fluid such as Na_2CO_3 soln. and after being transiently held from being carried along by the current of fluid are released by the cutting of the lumps into smaller subdivisions which are subjected to violent agitation to effect soln. Undissolved material is returned for retreatment. An app. is described.

Ink. HERMANN SCHLADERBACH and HERBERT HAHLE. U. S. 1,645,117, Oct. 11. An ink suitable for writing comprises an azo dye which dyes cotton directly and a free alk. substance such as NaOH in sufficient quantity to render writings produced with the ink fast to H_2O .

Artificial resin. E. C. ROSSITER. Can. 274,738, Oct. 18, 1927. A condensation product of urea and thiourea with CH_2O is produced by separately condensing urea with CH_2O and thiourea with CH_2O so that the products are left in soln., mixing the 2 solns. together and concg. the soln. so obtained by evapn.

Phenol-methylene resins from alcohol and methylals. C. B. CARTER. U. S. 1,645,226, Oct. 11. A phenolic compd. such as PhOH is boiled at substantially atm. pressure together with methylal and a quantity of H_2SO_4 or other suitable inorg. acid in excess of 10% of the reaction mixt.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL.

Composition of the body oil from sperm whale. I. Fatty acids. YOSHIYUKI TOYAMA. *J. Soc. Chem. Ind. Japan* 30, 519–27 (1927).—The oil prepd. exclusively from the body blubber of sperm whale (*Physeter macrocephalus* L.) is orange-yellow and deposits at ordinary temp. a considerable amt. of cryst. solid: d_4^{20} 0.8806, d_4^{30} 0.8733, n_D^{20} 1.4620, acid value 1.24, sapon. value 131.6, I value 82.4, unsaponif. matter 36.40% and fatty acids 64.13%. The fatty acids are orange-yellow and liquid at ordinary temp., having d_4^{20} 0.8918, d_4^{30} 0.8847, n_D^{20} 1.4602, n_D^{30} 1.4564, neutralization value 199.2, sapon. value 201.8, I value 87.4 and Et_2O -insol. bromides 5.55%. The fatty acids consist of about 10% satd. and 90% unsatd. acids. The latter consist for the most part of the acids of the oleic series; the acids more unsatd. than those of the oleic series are present in a few %. Myristic, palmitic, stearic acids and a small quantity of arachidic acid form the satd. acids; palmitic acid is preponderant. Lower satd. acids with less than 14 C atoms, which contain most likely lauric acid together with lower members, are also present in a small quantity. The acids of the oleic series contain zoomaric and oleic acids, an acid $\text{C}_{20}\text{H}_{38}\text{O}_2$, and cetoleic acid. An acid $\text{C}_{14}\text{H}_{26}\text{O}_2$ is also present in small quantity. Lower members of the oleic series with less than 14 C atoms are absent or present only in minute amt. The acids more unsatd. than those of the oleic series are in addition to C_{22} acids also C_{20} and C_{18} acids. The presence of clupanodonic acid, $\text{C}_{22}\text{H}_{34}\text{O}_2$, is confirmed. No evidence is obtained for the presence of physeteleic acid exhibiting the properties stated by Hofstädter (*Ann.* 177 (1854)) and Tsujimoto (*C. A.* 15, 2006); this is an impure zoomaric acid.

II. Unsaponifiable matter. *Ibid* 527–32.—The unsapon. matter is yellow and forms at ordinary temp. a cryst. solid: d_4^{20} 0.8508, d_4^{30} 0.8413, n_D^{30} 1.4550, sapon. value of acetylated product 186.6, I value 72.2 and cholesterol content (by digitonin method) 0.41%. It consists chiefly of oleyl alc. (octadecenol), cetyl alc. and octadecanol, of which oleyl alc. is preponderant. It contains also small quantities of more unsatd. acls. than oleyl alc., among which highly unsatd. acls. giving Et_2O -insol. bromides are found. Besides these acls., cholesterol is present. Hexadecenol is absent or present in minute amt. Tetradecanol was not detected. Oleyl acetate, b_p 217–20°, yields,

on oxidation with KMnO_4 in AcOH soln., monoic acid and acetylhydroxynonoic acid; from this the constitution of oleyl alc. should be $\text{Me}(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$, which is identical with that of the alc. from liver oil of *Chlamydoselachus anguineus* Garman. K. K.

Application of adsorptive carbons to crude vegetable oils. J. P. HARRIS. *Oil Fat Ind.* 4, 329-30(1927).—By treating crude coconut oil contg. 5% free fatty acid in the cold with adsorptive C, the neutralizing loss has been reduced to 5.5%; such results are consistent with varying % of free fatty acids. Two large-scale tests were made with cottonseed oil, as follows. The oil was first filtered and then 0.25% of adsorptive C together with 0.25% of diatomaceous earth added and the mixt. agitated at 28° for 30 min. The oil was then filtered again. In the 1st test untreated crude oil contg. 2.9% free acid was refined with 10% of 15° B. NaOH; there was a loss of 8.1%. Carbon-treated crude oil refined with the same amt. of NaOH lost 5.95%. In the 2nd test untreated crude oil contg. 3.54% free fatty acids gave a refining loss of 10.60%. With carbon-treated crude the loss was 7.10%. The refined oil from the C-treated crude was lighter and brighter without any further treatment than the refined and bleached oil from the untreated crude. The deodorizing time of the C-treated crude was reduced 45 min. per batch. E. SCHERUBEL

The behavior of fish oils with uranium nitrate and pyrogallie acid. W. H. DICKHART. *Oil Fat Ind.* 4, 326 8(1927).—The following test is proposed: Place 10 mg. of $\text{UO}_2(\text{NO}_3)_2$ and 3 cc. of the fish oil in a test tube and heat on a steam bath for 20 min., shaking occasionally. Remove and observe the color, which should be as follows: U. S. P. cod-liver oil, amber, showing a greenish cast with transmitted light. Norwegian sperm oil, light amber color, no change with transmitted light. Menhaden oil crimson. Pilchard oil, light red. Whale oil, light brownish red. Herring oil, blood-red. Sardine oil, blood red. Newfoundland cod oil, blood-red. Samples of cod-liver oil answering all U. S. P. requirements except that they were high in unsapon. matter gave a red coloration within 6 min. and were declared contaminated. E. SCHERUBEL

Detection of extracted olive oils. M. F. LAURO. *Oil Fat Ind.* 4, 324-5(1927).—The various tests for extd. oils are based on reactions with traces of solvents left in the oils after extrn. L. employs the following test. About 5 cc. of the oil is heated in a test tube to 150° and a pinch of BzOAg added and shaken. If any S-bearing solvent is present the oil will darken. The test has been found sensitive to 0.2% of olive-oil foots in a pressed oil. Neither the "com" nor "Pachini" test reveals this amt. The test may be made quant. by comparing the color produced against that shown by standards. E. SCHERUBEL

Determination of iodine-bromine values with potassium bromate and arsenite solutions. L. W. WINKLER. *Arch. Pharm.* 265, 554-60(1927).—With reference to the Ger. Pharm. method for detg. the IBV values of oils and fats, W. shows exptly. that instead of the prescribed alkaline arsenite soln., an acid reagent is better on account of its greater stability with respect to atm. O. Furthermore, an arsenite reagent of 0.25 N strength is preferable to one 0.5 N. Precise details are given for the modified procedure. W. O. E.

Determination of cold test on oils. T. A. FAUST, et al. *J. Am. Leather Chem. Assoc.* 22, 525 8(1927).—A discussion of proposed methods and their short comings. H. B. MERRILL

The determination of water in oils. H. PFLUG. *Chem.-Ztg.* 51, 717-8(1927).—P. modifies Oertel's method (*C.* 15, 768, 1410) as follows. Measure 25 cc. of the oil into a tube insulated in a porcelain beaker by Kieselguhr; stir the oil with a thermometer graduated into $\frac{1}{2}^\circ$, and note the temp. when it remains const. for 3 min. Add 10 g. of a mixt. of 2 parts anhyd. MgSO_4 and 1 part powd. quartz, stir and note the max. temp. Multiply the diff. between the 2 readings by 0.6 to obtain % H_2O . The factor 0.6 holds good for tar oils and petroleum, and is based on the heat of hydration to $\text{MgSO}_4 \cdot 7\text{H}_2\text{O} = 13.7$ cal. and the sp. heats of tar (0.5), anhyd. MgSO_4 (0.22) and SiO_2 (0.19). If the temp. increase is more than 13° , dil. the oil to be tested with 3 parts of a similar oil but free from H_2O , and multiply the result by 4. P. ESCHER

Determination of the acetyl number. F. CRONER. *Z. angew. Chem.* 40, 1013-4(1927).—C. suggests a modification in the method for detg. the acetyl no. as proposed by the German Com. for Standard Analyt. Methods in Fat Analysis, by transferring the sapon. residue after the alc. evapn. to a long-necked Kjeldahl flask with connecting bulb, in order to prevent the mechanical carrying over of H_2SO_4 during the following distn. of AcOH . P. ESCHER

Cacao-butter substitutes and their detection. A. W. KNAPP, J. E. MOSS and A. MELLEY. *Analyst* 52, 452-6(1927).—The only substitutes commonly present in

cacao butter appear to be coconut or palm-kernel stearin and the so-called illipé butters. As little as 5% of coconut or palm kernel stearin can be readily detected for, with pure cacao butter which is not rancid, neither the Reichert-Meissl nor the Polenske value exceeds 0.3. The so-called illipé butter used is not the true butter of this name but is more likely to be Borneo tallow and this has high iodine values and high Zeiss spectrometer values. The "titre" of the fatty acids of good cacao butter is 49-50°, whereas for Borneo tallow it is 54.6°. Other methods which have been recommended for the detection of adulterants are discussed and their limitations pointed out.

W. T. H.

Analysis of a mixture of olive oil and peanut oil. SIRO MARTINOLI. *Pharm. Acta Helv.* **2**, 15-8, 30-9, 54-9 (1927). (In Italian.)—A detailed exptl. study of the phys. and chem. consts. of a mixt. (the proportion not stated) of freshly expressed peanut oil and refined olive oil. The results are tabulated, compared in each case with recorded values of the single oils. (1) The phys. properties generally show increased values compared with the av. values of the components. (2) The chem. properties vary according to acidity or rancidity: the Reichert no., the abs. I no., acid no., sapon. no., increased; the Helmer no. and the relative I no. remain the same, while the mol. wt. diminishes. (3) Freshly expressed peanut oil seems to contain anhydrides and esters, on account of which the Ac no. is greatly increased. (4) The Ac no., therefore, cannot be considered a const., much less can it be a measure of the hydroxylated fatty acids, unless one succeeds in breaking down by chem. means the complex of the saponified fatty acids. (5) On account of (3), a certain relation exists between the Ac no. and the sapon. no.

S. WALDBOTT

Contribution to the study of cakes formed by the neutralization of oils. VIZERN and GILLOT. *Ind. chim. anal. chim. appl.* **9**, 257-61 (1927).—An interesting discussion of the chem. nature of oil cakes. It is recommended to det. (1) the % of total fatty matter in the cake, (2) the % of fat combined in the form of soap and (3) acidity of the cake.

W. T. H.

Hydrogenated squalene. MIKISAKI TSCHIMOTO. *Chem. Umschau Fette, Oele, Wachs u. Harze* **34**, 256-8 (1927).—The liver oil of Zamens, black shark, was hydrogenated on a semi-conv. scale over Ni catalyst. The product, "squalane," 46-47%, cont. 4.2 sapon. no. 82.8, I no. 1.2, unsapon. 51.43%. The fatty acids m. 58-59°, sapon. no. 177.5 and I no. 0.0. The unsapon. matter is light yellow, semi-solid, cont. 70% I no. 1.4. Besides $C_{30}H_{50}$, $C_{31}H_{52}$, the hydrogenated product contains fatty alcohols, which had been of iron schetyl ole. A distn. of 1000 g. of the hydro. oil at 3.4 mm. yielded 39% of a stillate at 236°, partly liquid and partly solid. A distillation and re-fraction of the stillate at 4.6 mm. over Na, there were obtained pure squalane, dodecahydro-squalene, with the following consts.: b_p 248°, b₁₀ 101.5°, n_D^{20} 1.48117, n_D^{25} 1.4739, mol. refraction, 136.2, viscosity Ostwald 15° 36.9, 25° 15.4, 35° 10.7, 40° 8.21 sec., 15° 321 sec., 30° 118 sec., flash p. Pensky-Martens 190°, density 0.89% loss after 6 hrs., readily sol. in ether, gasoline, $CHCl_3$, slightly sol. in acetone and glacial AcOH. Conc'd. H_2SO_4 at 70° is discolored but the squalane remains unchanged. Its low s. p. and its high b. p. and resistance toward air and squalane as a lubricant and transformer oil.

P. ESCHER

Hydrogenation of oleic acid by activated hydrogen. H. I. WATERMAN AND S. H. GRANN. *Chem. Umschau Fette, Oele, Wachs u. Harze* **34**, 255-6 (1927); cf. C. A. **1**, 66. Pure oleic acid, contg. 0.3 and 0.5% of satd. acids was hydrogenated in 3% with dry H_2 , activated by a silent discharge from a current of 7.5 amp., at 220 v., spark of 40 cm. in air. After 35-65 hrs. at 0.5-2.0 mm. pressure at 15-30° the product showed an I no. of 77.1-84.6, n_D^{70} 1.44221-1.4425, m. 31-35°, satd. 42-42°, with a mol. wt. of 305.5 and a m. p. of 69.9°. W. and B. conclude that hydrogenation was accompanied by some polymerization.

P. ESCHER

Oxidized fatty acids. D. POLLMANN. *Seifensieder-Ztg.* **54**, 602-4, 625-6 (1927).—From correct results in the analytical detn. of "hydroxy acids" by Fahrion's gasoline sol., it is essential first to saponify the fat, even when already in the form of free acids. The dark color of the acids usually appears on acidifying after sapon. The acids are more sol. in fatty acids and in ethyl esters of the acids than in their esters. Satd. acids may also become oxidized; Merck's stearic acid, contg. 5.9% of oxidized acid, after being heated for 16 days to 110° in a cotton-plugged flask, showed 15% oleic and 10% hydroxy acids, the latter of an I no. of 10.2 (= 11% oleic acid). Fe and Cu salts in the formation of dark substances, the color itself not being due to Fe. Fe and Al slightly favors development of color; the older the acids, the more rapid the darkening. Na salts of the oxidized acids are not easily salted out but salts

of true hydroxy acids like ricinolic and dihydroxystearic acid are readily salted out. Reduction of oxidized acids by P and HI in a sealed tube resulted in high viscosity, lighter-colored Na salts and ready sept. when salted out; they remained, however, insol in gasoline; hydroxy acids were absent. The whole phenomenon has the appearance of polymerization, forming high-molecular compds. that resemble fatty acids.

P. ESCHER

Linolic acid content of bone grease. H. STADLINGER AND E. TSCHIRCH. *Chem.-Ztg.* **51**, 667-9, 686-8, 706-8 (1927). The linolic acid was detd. by Kaufmann's thiocyanometric method. Weigh 8.4 g. Br into a 500-cc. flask, add 200 cc. CCl_4 and make up to 500 cc. with glacial AcOH (= soln. A), weigh 25 g. $\text{Pb}(\text{SCN})_2$ into a dry half-gal. glass-stoppered bottle and add 500 cc. glacial AcOH (= soln. B); transfer A into B very gradually with const. shaking; settle and filter into a glass-stoppered bottle. Standardize this approx. 0.1 N soln. of $(\text{SCN})_2$ by adding 25 cc. of it to 20 cc. 5% KI soln. and 50 cc. H_2O and titrate against 0.1 N $\text{Na}_2\text{S}_2\text{O}_3$. Weigh accurately into a glass-stoppered Erlenmeyer flask 0.1 to 0.2 g. of fat and add 25 cc. $(\text{SCN})_2$ soln. Let stand 24 hrs. Pour it into 20 cc. 5% KI soln., rinse with KI and titrate back against 0.1 N $\text{Na}_2\text{S}_2\text{O}_3$: % linolic acid (x) = $1.104(I-S)$; % oleic acid (y) = $1.112(2S-I)$; % satd. acids = $100 - x - y$. I = I no. of the fat, S = thiocyanometric I no. of the fat = cc. $\text{Na}_2\text{S}_2\text{O}_3$ absorbed $\times 1.27$ ÷ wt. of fat. Fresh bone grease from calf bones contained 4.6% linolic acid, from beef bones 4.2% and from household beef bones 5.6%. Test mixts. of bone grease with added linolic acid agreed within less than 1% with calcd. amts. Linolic acid detns. in commercial bone greases show that the grease must first be freed from lime soaps, etc., by an acid wash before comparable results can be obtained, and that the Kaufmann values and I nos. must be detd. on the grease, not on its fatty acids. The av. values are given as follows:

Grease	min	% Linolic acid max	mean	I no Hanus	Kaufmann value	No. of samples
Refined						
bone grease	7.5	10.8	8.9	54.1-60.4	46.9-52.4	8
Crude						
bone grease	5.4	8.6	7.3	53.6-59.2	48.4-51.6	4
Pure						
bone grease (lab. made)	5.0	5.7	5.2	46.5-59.3	42.0-54.7	3

P. ESCHER

Decomposition of vegetable waxes. A. MAILHE. *Bull. soc. chim.* [4], **41**, 1056-61 (1927); cf. *C. A.* **18**, 3284. Gradual heating of 200 g. of *carnauba wax* with 15 g. fused ZnCl_2 caused sapon. of the esters followed by decompn. of the acids and alcs., with production of fixed gases (not detd.), an oily distillate (63% of the original wax), and a carbonaceous residue contg. the ZnCl_2 , which is partially converted into oxychloride. The compn. of the fixed gases sampled at 260° and 280° (measured in the vapors) was: CO_2 0.40, 0.39; CO 0.61, 0.49; C_nH_{2n} 6.49, 5.64; $\text{C}_n\text{H}_{2n+2}$ 2.12, 2.67; CH_4 16.14, 15.67; H 73.32, 74.25; O 0.92, 0.89%, resp. The distillate consists of a mixt. of CH_4 and C_2H_4 -hydrocarbons, up to and including paraffin (m. 56-8°), but free from aromatic and naphthenic hydrocarbons. As the temp. of decompn. increases, the proportion of C_2H_4 -hydrocarbons increases and of unsatd. decreases. Similar results are obtained with MgCl_2 instead of ZnCl_2 , but the reaction proceeds more slowly. Under the action of 10% fused ZnCl_2 *Japan wax* was decompd. in a manner similar to vegetable and animal oils and fats (*C. A.* **18**, 577). The gas sampled at 260° contained CO_2 4, CO 18.4, C_nH_{2n} 2.4, CH_4 27.3, H 46.9, O 0.1%. The distn. products are similar to those obtained from *carnauba wax*.

A. PAPINEAU-COUTURE

Free alkali in soaps. J. DAVIDSOHN. *Chem. Umschau Fette, Oele, Wachse u. Harze* **34**, 260 (1927); cf. *C. A.* **21**, 665. D. now modifies his method for detg. free alkali in soft soap, by decanting the alc. soap soln. from the Na_2SO_4 and washing the latter with abs. alc. and then titrating the soap soln., a sharper end point is claimed.

P. ESCHER

Soaps containing solvent. R. HUETER. *Seifensieder-Ztg.* **54**, 685-6 (1927).—The legitimate use in soaps of naphtha, tetralin, hexalin, etc., should not be restricted by fixing standards based only on the % of fatty acids. If only 1 or 2 of these solvents are present, sufficient data for quant. identification can be obtained by a steam distn. from its dil. acidified soln. and the sp. gr. of the distillate; if coconut oil is present, a titration of the distillate must be made to det. the volatile acids. If higher alcs. are present they must be salted out from the distillate by Na_2SO_4 , but even then butyl alc.,

for instance, retains 28% H_2O and must first be dried or extd. with petr. ether before correct sp. gr. or b. p. can be obtained. An acetyl no. of the distillate is of use when the nature of the alc. is known. The distillate may also be shaken out with ether to obtain gravimetrically the total solvent present. Non-volatile addns. like lanolin or spermaceti must be detd. from the insol. matter. A scheme is briefly outlined for the sepn. of most of the solvents that might be added to soaps. P. ESCHER

The behavior of soaps of various oils on dilution. H. B. STOCKS. *Oil Fat Ind.* 4, 315-19 (1927).—The pink color which develops with phenolphthalein in most soap solns. deepens as diln. is increased, but with castor-oil soaps only a faint pink was produced, which did not deepen on diln. On titrating soap solns. with standard acid it was found that the hydrolysis alkali increased up to a max. at a certain diln. (1 part soap in 150 parts H_2O); further diln. caused no change. With most of the soaps examd. the hydrolysis alkali amounts to 50% of the total, but castor-oil soap formed an exception, amounting to not more than 5% of the total. Expts. show that there is no appreciable hydrolysis in solns. of Na salts of fatty acids up to and including lauric acid, but after this there is a complete break, the hydrolysis alkali amounting to 50% of the total. Rosin acids behave similarly to fatty acids. The test suggested for distinguishing castor from other oils and detecting adulteration is as follows: Saponify 5 g. of oil with excess of alc. KOH under a reflux condenser, add phenolphthalein, neutralize with HCl and evap. the alc. Add H_2O to the residue and after soln. make up to 100 cc. Dil. 10 cc. (0.5 g. oil) to 250 cc. with boiled distd. H_2O and titrate with 0.1 N HCl, first with phenolphthalein and continuing with Me orange. With castor oil only about 0.5 to 0.8 cc. of 0.1 N acid was required in the 1st titration, whereas other fats and oils required 8 or 9 cc. Butter, coconut and palm-nut fats were exceptions, but the results are explainable by the presence of the lower fatty acids. Since 95% of the acids of castor oil are ricinoleic acid, it is evident that the salt of this acid does not hydrolyze to any considerable extent, and the difference in behavior between this and other soaps must be ascribed to this particular acid. E. SCHERUBEL

Detergent action of soaps. II. G. P. VINCENT. *J. Phys. Chem.* 31, 1281-315 (1927).—The solid particles held in stable suspension in a soap soln. possess a negative charge as the result of adsorption of ions from soln. The particle is also capable of adsorbing positive ions. If the ions are adsorbed equally no stable suspension is formed. Max. stabilization occurs at the soap concn. in which the negative ion is adsorbed most strongly in comparison with the positive. According to Fall (C. A. 21, 2811), this max. occurs at a soap concn. of 0.2-0.4%; according to McBain, at 4.45%. It was found that in the latter case, coarse non-stabilized C prevented the passage of the fine stabilized C through the filter. By preventing this interference, the result of McBain agrees with that of Fall. The cleansing of oils as an example of liquid dirt was studied. The soaps, Palm Oil, Olive Oil, Green Arrow, Silicated Green Arrow and Tallow, possess very nearly the same emulsifying powers. The necessary soap concn. is between 0.05 and 0.10%. Forty degrees is recommended as a convenient temp. Increase in temp. is detrimental to emulsification, whereas at room temp., the soln. is too viscous for proper and easy mixing. The addn. of alk. salts aids emulsification, undoubtedly because of the lowering of the surface tension of water toward oil in the presence of a soap soln. NaOH, Na_3PO_4 and NH_4OH are more efficient than Na_2CO_3 and borax. A soln. 0.32% in respect to NaOH, or 1.2% or more NH_4OH , is beneficial. NaOH or Na_3PO_4 in concd. soln. is detrimental. Na_2SiO_3 is of no value as an emulsifying agent. The detergent power of concd. soap solns. and of other solns. which are capable of removing oil without emulsification is ascribed to their "wetting" ability. Na_3PO_4 is of particular value as a detergent for greases contg. Ca soaps due to its ability to form Na soaps. NaOH is slightly less effective for grease contg. Ca soaps, but for a specific transmission grease examd., it was found a little superior to Na_3PO_4 . A detergent compd. contg. 20% soap and 80% Na_2SiO_3 had excellent emulsifying power. Such a product would probably increase the strength of cotton and reduce the amt. of free alkali. The amt. of shrinkage of wool caused by the mix was no greater than that caused by soap alone and the dye was less sol. Its effect as a water softener is considered. It is of extreme value for H_2O contg. Fe, of considerable value for H_2O contg. Mg, and of very little value for water contg. Ca. NaOH is more efficient than Na_2SiO_3 and Na_2CO_3 in softening H_2O contg. Fe. The beneficial effects obtained by adding Na_2SiO_3 to NaOCl bleach (cf. C. A. 20, 1143) are explained as follows: The strength of the bleaching soln. is conserved because the silicate retards the formation, and consequently the action, of HOCl. The increase in strength of the fiber is due to the adsorption of SiO_2 which strengthens the fiber to a greater extent than the bleaching weakens it. The color is improved because the presence of Na_2SiO_3 in the bleach aids in removing some slightly

yellow decompn. product, which otherwise is difficult to remove by washing. Exptl. evidence supporting the above views is given. RUBY K. WORNER

"Washed 511 times with Persil." B. WALTHER. *Seifensieder-Ztg.* 54, 623-5 (1927).—W. reports wash tests with "Persil" on fabrics half cotton and half linen, 40 metric threads 29×29 per sq. cm. The fabrics were immersed cold, brought to boiling, kept near 100° for 15 min., rinsed and squeezed. In 2 series of tests, after 50 washings the tensile strength of the cotton threads had decreased to 84.7 and 87.6%, its original value and that of the linen threads to 74.9 and 74.2% of the original value. These tests indicate that the 511 washings must have been made with special fabrics or under otherwise unusual conditions. P. ESCHER

The formation of fats by microorganisms. S. (SULZBER) 11A. Selection for quality of oil in soy beans (COLL, *et al.*) 11D. Oxidation of certain fatty acids (RHINE) 11D.

Sulfonating fats, oils and their acids. GOMM, H. T., AKT. GES. Brit. 263,117, Dec. 16, 1925. In effecting sulfonations, the presence of org. acid anhydrides or chlorides as described in Brit. 261,885 (*ibid.* 21, 3476) the proportion of anhydride or chloride is increased so that there is more than 1 mol. of anhydride or chloride for each mol. of oil, *et seq.*, equal parts of castor oil and Ac_2O may be used. A greater proportion of H_2SO_4 is thus combined and products are obtained useful as wetting agents, for cleansing, fat-splitting and other purposes.

Catalyst for hardening oils. CAPTION, F. L. U. S. 1,645,377, Oct. 11, 1927. Ni and Cu formates are used together (about 10-20% as much Cu as Ni).

Powdered soap by spray desiccation. GILLDAY, U. S. 167,499, Sept. 27, 1927. See original pat. 1,621,506 (*ibid.* 21, 1557).

Soap chips. A. F. JOHANSSON, Swed. 62,912, May 10, 1927. Soap, boiled with borax, the mass is cut into chips, then there are added separately Na_2CO_3 , turpentine and NH_4 , and the mixt. is worked to the desired consistency. A suitable compn. is pure soap 52, borax 10, Na_2CO_3 11, turpentine 10 and NH_4 14%, by weight.

Cleaning powder. KOOPERATIVA FORBUNDET, Swed. 62,211, Jan. 1, 1927. Saponifiable fat or oil together with the required amts. of NaOH and water and fine soda powder are blown into a container by means of compressed air in such a way that they are mixed intimately. Instantaneous sapon. takes place with formation of a dry soap powder, which accumulates in the bottom of the container.

Detergent. G. C. BRYSON, Can. 273,774, Sept. 13, 1927. A detergent is composed of 1200 cc. H_2O , 400 g. soap, 15 dr. alk., 14 dr. oleic acid, 6 dr. glycerol, 1 g. NaOH .

Detergent. AKTIEBOLAGET OXYGENOL, Swed. 63,314, July 12, 1927. Soap powder is mixed with insol. porous substances and with a neutral stearate of Ca, Mg or Zn or acid K or Na stearate.

28 - SUGAR, STARCH AND GUMS

The present status of the Louisiana sugar industry. A. H. ROSENFELD. *Int. Sugar J.* 29, 355-61 (1927).—R. discusses the causes for the decrease in production which has fallen from 263,476 tons in 1918 to 42,112 tons in 1926. W. L. OWEN

The composition of juices in the campaign of 1926-7. JIRÍ VONDRÁK. *Z. Zuckerind. czechoslov. Rep.* 51, 393-7 (1927); *Časť Cukrovar.* 45, 227 ff. (1926-7).—The weather in the growing season was unusually rainy, but the only serious difference noticed in the mills was an ally of the juices so high as to make boiling difficult. The av. of 3 samples of diffusion juice showed: Brix 17.07, polarization 15.59, purity 91.3, invert 0.10. Calcd. to 100 polarization, nonsugars 9.5, sulfate ash 2.60, total N 0.431, albumin N 0.078, ammonia N 0.026, amino N 0.112, betaine N 0.108, harmful N 0.257. Thick juice averages were: Brix 61.91, polarization 58.79, purity 95.0, Clerget 7.7 alk., % CaO to phenolphthalein 0.050, color, degrees Stammer, 9.7. Calcd. to 100 polarization, nonsugars 9.5, sulfate ash 2.02, Ca salts as CaO 0.023, color, mg. Fe 12.8, total N 0.286, albumin N 0.002, ammonia N 0.006, amino N 0.040, betaine N 0.105, harmful N 0.258. The thick juice had the lowest N for several years. W. L. BADGER

Filter cloths in the campaigns of 1916-17 and 1920-21. K. ŠANDERA. *Z. Zuckerind. czechoslov. Rep.* 51, 385-92 (1927); *Časť Cukrovar.* 45, 69 ff. (1926-7).—A summary of the results of 2 questionnaires shows the widest divergence in frequency of changing cloths, frequency of washing, and total life. None of the results could be coordinated.

with variations in operation. In 1916-17, 24% of the mills reporting changed cloths oftener than 7 days, 37% changed in 7 to 14 days,*and 39% used the cloths longer than 14 days. In 1920-21 the corresponding figures were 39%, 33% and 28%. Tearing tests on samples of new and used cloths showed that some mills discarded cloths when down to 50-70% of the original strength, while others used them till only 20-25% of the original strength was left. It is recommended that cotton cloths be discarded when they fall to 25% of their original strength, linen at 40%, and jute not less than 50%. Single or double cotton cloths were greatly preferred in most mills; cotton over jute next, and jute alone or linen alone least.

W. L. BADGER

Some properties of cane-wax complex. C. F. BARDORF. *Can. Chem. Met.* 11, 231-4 (1927).—The waxy material naturally occurring in the sugar cane persists throughout the raw-sugar factory and can be traced again throughout the refinery. It is adsorbed to a varying extent by filter cloth, paper pulp, kieselguhr, and especially by bone char. Cane wax was detd. in the rind of the cane and in the different products of the raw-sugar factory, in the case of solid materials by direct extn. with hot acetone and hot alc., and in solns. by first trapping by means of Na_3PO_4 , followed by extn. with the solvents named. Filter-press cake on a Cuban estate contained 21.16% of wax, and molasses may contain 2-3%. The wax complex consists of at least 5 different constituents, 3 extd. by acetone, 1 by alc. and 1 by H_2O , but the most important are an olive-green, soft wax, m. 52° , extd. by acetone, and a brown wax, m. 82° extd. by alc. The quantities of material extd. by acetone and alc. from a no. of raw-sugar-factory products are shown in a table. The green wax can be heated to 460° without decomposition; it boils at $470-80^\circ$. The brown wax is a little less stable, and starts to decompose almost as soon as boiling begins at 450° . The green wax contains 6-7% of an oil which distills off at $280-300^\circ$. The waxes can easily be emulsified in H_2O or sugar soln., by shaking at 40° or over, giving practically uncolored emulsions. But the oil contained in the acetone ext. gives a decidedly brown coloration, under the same conditions. The wax complexes are very resistant to H_2SO_4 and to strong NaOH soln. in the cold. The sapon. nos. of both complexes are very high, varying from 168 to as much as 860, depending on their source. Further studies are promised.

F. W. ZERBAN

Sugar losses in the storage of beets. J. J. DOCHLENKO. *Zapiski* 4, 77-86 (1926-7). *Centr. Zuckerrind.* 35, 301-2 (1927).—Samples of beets were enclosed in nets and stored in silos. The sugar loss was 0.012% per day in 1924 and 0.021 in 1925. In warm weather the beets rotted rapidly, the rotted parts showing no sucrose, much invert, and high acidity. Molds also appeared, and the moldy beets showed less sucrose, more invert, and higher acidity than sound beets. The molds started on injured areas, but when once started, spread rapidly through the silo. One % formalin had no effect. Three % formalin killed the molds, but made the beets woody. Lime milk of 7°Bé . was most effective. On long storage the harmful N increased somewhat in sprouted beets and considerably in moldy beets. This was accompanied by a decrease in total N, a decrease in albumin N, and no marked change in amino or ammonia N.

W. L. BADGER

Experiments on beet silos. SIEGFRIED KUDELKA AND ERNST SCHOLTZ. *Z. Zuckerrind. czechoslov. Rep.* 51, 347-52, 365-8 (1927).—Beets were stored in (A) a silo 3 m. wide at the bottom and 3.3 m. deep, (B) the same but with a ventilation canal under the center, and (C) an unventilated silo 4 m. wide at the bottom and 2.2 m. deep. Sample lots of beets were stored at various points in nets so that samples could be taken, and thermometers were inserted at various points. The test lasted 40 days, and the weather was rather mild. Gates on the ventilation canal under (B) were opened once at night or on cold days. The av. sugar loss per day in % on beets was: (A) 0.0201%; (B) 0.0159%; (C) 0.0156%. By taking losses over shorter periods of fairly constant temp. and plotting against temp., a smooth curve was obtained, ranging from 0.010% loss at 8.9° to 0.030% at 15.1° . The smaller silos are preferable as there is less loss of overheating, but large silos properly ventilated are about as good. The lowering of temp. by proper ventilation more than offsets any loss due to increased vegetation. In both ventilated and unventilated silos the temp. was highest in the upper layers. Beets were also stored in heaps of about 30 kg. in a well-ventilated cellar, and showed a sugar loss of 0.0547% per day over 60 days. Different types of beets in a large silo showed that poorly topped beets did not lose sugar for some days (apparently due to outer ripening) but then sprouted and lost sugar much faster than properly topped beets. Small beets kept better than large ones. Beets of high sugar content (20-21%) lost 0.06-0.07% sugar per day; beets of 16-17% sugar lost 0.03-0.04% per day.

W. L. BADGER

Conserving sugar beets by drying. G. S. BENIN. *Nauchnye Zapiski* (Russian) 5, 49-55(1927); cf. C. A. 21, 3282. • The purification of the diffusion juice from dried sugar beets by the ordinary methods of defecation may be accomplished with a fair degree of success. The color of the purified juice is deeper when the product is derived from dried beets and a special decolorizing operation is necessary. Expts. on drying under reduced pressure showed that the beets loose just as much sugar as when dried in the ordinary way. J. S. JOFFE

Testing sugar beets for inversion and for sugar content of the diffused juice produced from them. N. I. KARAVAEV AND A. PALKIN. *Bull. Univ. Asie centrale* (Tashkent) 10, 125-8(1925). *Chem. Zentr.* 1926, II, 663-4.—Drying of fresh sugar beets reduces the cost of transportation, makes possible the production of concd. ext. and eliminates loss by perishing. There is no inversion of the sucrose by drying at 60-100° or in sunshine until the beets had lost 60-68% by wt., resulting in an increased invert sugar content of only 0.002-0.005%. The diffusion of the sugar from the dried beets was no different from that from fresh beets, but the sugar content of the ext. was much higher for the dried beets (30.4% compared with 15.4%). C. C. DAVIS

Electrometric determination of the "vitality" of vegetable tissues and measurements of the toxicity of certain poisons on the beet. F. NEUWIRTH. *Z. Zuckerind. czechoslov. Rep.* 51, 249-57(1927). *Listy Cukrovar.* 45, 61ff.(1926-7).—A Zn and a Ag electrode were inserted into beet tissue, and connected through a high resistance to a galvanometer. Resistance of the tissue was expressed as millivolts read. Sound live beets gave 50-65 millivolts, dead tissue up to 180. SO₂ and NH₃ killed the beet in less than 1 hr., H₂S and CHCl₃ after 10 hrs. Chloropicrin, Et₂O, CO₂, solvent naphtha and p-C₆H₄Cl₂ had little or no effect after 10 hrs. W. L. BADGER

Amino acids and related compounds in sugar products. J. A. AMBLER. *Intern. Sugar J.* 29, 382-5, 437-41(1927).—Amino acids in cane and beet juices are responsible for many abnormalities in the working of the juice at certain times and for the occasional abnormal behavior of the molasses, such as in the foaming of massecuites, or the formation of gas in molasses which causes "swells" in cans. The ordinary tests for amino acids are not applicable to sugar products because of the very small quantities that are present. A simple modification of Riffart's method (C. A. 16, 4228) is satisfactory for sugar work. Prep. a standard soln. of aspartic acid contg. 0.4749 g. of the acid in 500 cc., or 100 mg. N per l. From this soln. make other standards contg. from 5 to 25 mg. N per l. Prep. two M/15 solns., of KH₂PO₄ and Na₂HPO₄·2H₂O, resp., and mix in the ratio of 2 to 3 immediately before using; the p_H of this buffer soln. is 6.796. To the tubes contg. 1 cc. each of the standard solns. add 1 cc. of a 50 Bx. soln. of granulated sugar, and to the unknown soln. 1 cc. of distd. H₂O, then to all of the tubes 2 cc. of the mixed buffer soln. and 1 cc. of 1% ninhydrin soln. Place the tubes in a wire basket and heat for 0.5 hr. in a boiling water bath. Cool for 0.5 hr., transfer to measuring cylinders, dil. to 100 cc. with cold H₂O, and compare colorimetrically. Previous difficulties with the method were due to variations in the p_H. The method was tested on refinery products, with very satisfactory results. Bone char removes about 70-80% of the amino acids from concd. sirups, but their concn. increases about 200 to 300% in the sweet waters, and still further in the wash-water to the sewer. W. L. O.

Analysis of sugars by comparative measurements of fluorescence. HARALD LUNDÉN. *Centr. Zuckerind.* 35, 219-20(1927).—Crystals of a purity over 99.95 cannot be exactly evaluated by ordinary methods. In the ultra-violet such material shows marked fluorescence, and the fluorescence is roughly parallel to the amt. of impurities. Different sized grains have different fluorescence. Dyes which affect the color of a sugar in visible light do not affect its appearance in ultra-violet light. Cane and beet can be easily distinguished. The examn. is made in solns. of 40-60° Brix, and numerical values are obtained by dilg. till equal to a standard. Two fluorescence bands are found. The yellow one increases with increasing alk. and is caused by substances formed on heating the juice. These substances are less absorbed by the crystals on crystg. a soln., and are more easily removed by decolorizing carbons. The blue fluorescence decreases with increasing alk. between p_H 5 and 11, and is especially strong in colonial sugars. The substances causing it are removed by kieselguhr, and are strongly absorbed by growing crystals. Good beet products show yellow fluorescence, only the best refined beet sugar showing blue fluorescence. The blue fluorescence corresponds to L.'s amethyst coloring matter (cf. Šandera, C. A. 21, 3761). W. L. BADGER

Practical application of p_H determinations at the sugar factory Gondang Winan- (Java). H. A. MACGILLAVRY AND J. DEINEMA. *Arch. Suikerind.* 35, 872-7(1927).—Titrations and the use of litmus paper for thin juice tests have been abandoned. Bromothymol blue is now being used instead, in connection with the color

charts of the expt. station. In 1st carbonation the settling test is employed, together with the use of Dupont paper. The 2nd carbonation is still controlled by titration, but after a further study it will probably be possible to substitute p_H detns. A series of expts. has shown that it is best to sulfur the thin juice to p_H 7.1, bromothymol blue and bromocresol purple being used. Under these conditions it is generally unnecessary to sulfur the thick juice. The p_H of the thick juice is usually about 0.1 higher than that of the thin juice. The new control has made it possible to reduce the quantity of S used; on account of the neutral reaction of the juices there is less destruction of glucose, and therefore less frothing of massecuites; the viscosity of the products, especially of the low-grade massecuites, has also been reduced. F. W. ZERBAN

Polarization apparatus with photoelectric indication. WINIFRED E. DICKES. *Z. Zuckerind. u. o. choslov. Rep.* 51, 379-80(1927).—The app. of Staněk and Šandera (*C. A.* 21, 3492) if properly arranged should have a sensitivity of 0.02° Ventzke instead of 1° as claimed. W. L. BADGER

Comparison of the results of molasses analyses, obtained in the factory laboratories and at the experiment station, for the years 1925-26 (Java). P. HONIG. *Arch. Suikerind.* 35, 859-72(1927).—The analyses were made in both cases by the official methods of the expt. station (*C. A.* 21, 191). The comparisons are shown in the form of tables and graphs. Checks between d. detns. were not very good. Many factories still use the spindle instead of the pycnometer; for this reason their results are generally high, first because the fine ppt. formed upon diln. of the molasses settles to the bottom, causing a higher d. around the bulb of the spindle, and second because the molasses soln. has a lower surface tension than a sucrose soln. of the same concn. Polarization as well as sucrose figures checked very well in a large no. of cases; with a little more care better agreement could easily be attained in the others. Results of reducing sugar detns. show considerable differences, those obtained in the factories generally being low. It appears that the method is not well suited for the factory lab. A better supervision of the personnel by a trained chemist is necessary. F. W. ZERBAN

Deterioration of cane mill juices and its prevention by antiseptic measures. J. H. HALDANE. *Intern. Sugar J.* 29, 367-70(1927).—It is now generally recognized that the losses in sucrose during milling, due directly and indirectly to the development of microorganisms, are considerable. This is apparent from comparisons of differences in purity between first mill and mixed juices in factories where precautions are taken to prevent the growth of microorganisms, and in those where they are not. Preliminary investigations suggested the possibility of using a cheap antiseptic like "E. C." (*Intern. Sugar J.* 28, 85(1926); cf. *C. A.* 20, 1531) to great advantage. Expts. were made comparing the efficiency of E. C. and formalin, on crusher, mixed and last-mill juice, resp. The results showed that the 2 substances are approx. equally efficient. Although the inverting activities of microorganisms can be restrained by the use of these antiseptics, some loss of sucrose will still occur, dependent upon acidity, concn., and temp. E. C. is recommended as a preventive of the deterioration of cane juice during milling. After a wash down, and periodically during milling, the mill beds, cheeks and gutters, and intermediate carriers should be sprayed with E. C. contg. 2% Cl. A continuous trickle of a 1.500 soln. of the antiseptic should be allowed to flow into all juice gutters to prevent the deterioration of the juices during their passage through the mill. The concn. of the E. C. should be increased to 1:200 during the latter stages. W. L. OWEN

The defecation of diffusion juice with dolomitic lime, and with mud obtained by defecating intermediate juice with dolomitic lime. WENZEL KOHN. *Z. Zuckerind. u. o. choslov. Rep.* 50, 209-15, 217-21(1926); *Listy Cukrovar.* 42, 297ff.(1923-4).—If dolomitic lime is added to diffusion juice in amts. from 0.35 to 0.40% of the juice vol., after warming the ppt. settles rapidly and satisfactorily, but amts. over 0.4% do not settle at all. Overcarbonating improved the settling only in a few cases. Adding to diffusion juice, mud from 2nd juice which had been carbonated with dolomitic lime, gave unsatisfactory clarification and darker juices, though the purity was not lowered. Adding 2nd mud after the 1st carbonation but before the 1st filtration had no harmful effect. A juice limed and carbonated twice with dolomitic lime showed poorer color and purity than when the same amt. of dolomitic lime was used but the mud was not filtered off between carbonations. W. L. BADGER

Continuous automatic measuring outfit for the diffusion juice. P. R. CHECHEL. *Nauchn. Zapiski* (Russian) 5, 57-9(1927).—A description of an app. and a drawing with explanations. J. S. JOFFE

Effect of the color of juices and green sirups on the color of sugar crystals. WALTER KORN. *Centr. Zuckerind.* 35, 496-7(1927).—Five different pans were followed closely

and full data are given. Small variations in the color of the sirup are of little effect on the color of the crystal, but if 35% or more of green sirup is drawn in, there is a decided increase in the color of the sugar produced.

W. L. BADGER

Decolorizing carbons. SIEGFRIED KÜHN. *Z. Zuckerind. cechoslov. Rep.* **51**, 271-2(1927); cf. *C. A.* **21**, 832.—A question often raised is the necessity for pre-filtration in using carbons by the "layer" method. Total suspended substance in the liquor from the dissolving pans was 0.08-0.15 g. (av. 0.11) per kg. affined sugar. Of this about $\frac{1}{3}$ was org. and $\frac{2}{3}$ inorg. Similar detns. on liquors ready for pre-filtration gave about 0.4 g. per kg. affined sugar, mainly inorg.

W. L. BADGER

Further experiments with decolorizing carbons. ALBERT SCHÖNE. *Deut. Zuckerind.* **52**, 323-4(1927); cf. *C. A.* **20**, 2917; **21**, 832.—A 60° Brix sirup (alky. 0.02%) made from refined sugar was heated 15 min. at 85-90° with varying amts. of Carboraffin and Norit. There was a decrease of alky. and an increase in invert with both, the effect being larger with larger amts. of either, and larger with C than with N. In a 2nd series where sirups of different alkys. were used and color was also detd., the results were similar. C had the stronger decolorizing power, and caused a systematic increase in inversion as the amt. used was increased. The inversion caused by N was not only smaller but was erratic.

W. L. BADGER

Technical experiments with various activated carbons in the campaign of 1925-6. A. LINSBAUER AND JAR. FIŠER. *Z. Zuckerind. cechoslov. Rep.* **51**, 353 65, 369-79(1927); *Listy Kukurar.* **45**, 101ff.(1926-7).—Four large-scale expts. were carried out using (a) Carboraffin, (b) Polycarbon, (c) Supranorit 2x, (d) Supranorit 3x, (e) Superiornorit, (f) Standard Norit, and (g) Anticromos. The method of "filtration in layers" was adopted, using both filter presses and mech. filters. Two kg. of the carbon was used per sq. m., the temp. was held at 80°, and the rate of filtration at 1 hectoliter per sq. m. per hr. (2.46 gal. per sq. ft.). With mech. filters the % color removal was (a) 40, (b) 39, (c) 39, (d) 44, (e) 35. Thick juice in the same filters gave: (a) 38, (b) 23.5, (c) 37, (d) 29. In filter presses the % color removed from 1st refinery sirups was: (a) 32, (b) 29, (f) 29, (g) 32.5; for 2nd sirups: (a) 14.7, (b) 4.6, (f) 16.5, (g) 8.3; for thick juice from partly altered beets: (a) 16.4, (d) 15.4. Filter presses are not recommended for the "layer" method. All the carbons were in general satisfactory, in spite of differences in price and in the results of lab. evaluating tests. Carboraffin 1925 is of remarkably better quality than Carboraffin 1924. Polycarbon and Anticromos are well suited to 1st refinery sirups but not for beet mill products. For sirups the cheapest sorts of carbon, liberally used, are recommended. Careful and continuous control of the filter station is necessary.

W. L. BADGER

The regeneration of active carbons. ADOLF RIERETH. *Centr. Zuckerind.* **35**, 332-3(1927).—Samples of active C were treated with molasses soln. until the decolorizing power was completely destroyed. They were then heated in a vacuum to 900° and then re-tested. The % color removed from a 5% molasses soln. by fresh carbon (a), once regenerated (b), twice (c), and 3 times regenerated (d), was: Eponite I, (a) 99, (b) 98.5, (c) 88.5, (d) 66; Eponite II, (a) 96, (b) 97, (c) 83.5, (d) 42.5; Carboraffin, (a) 97, (b) 40, (c) 12, (d) 2.

W. L. BADGER

Carboraffin and Norit. MAKULIK. *Deut. Zuckerind.* **52**, 133-4(1927).—The entire refinery was operated 9 days on Supra-Norit 2X, and 7 days on carboraffin. Brix, polarization purity and color, were approx. the same in the sirups used for the 2 tests. With Norit the color was lowered 14.9% (from 58.3 to 49.6° Stammer); with carboraffin the removal was 25.0% (from 54.0° to 40.5°). KATHOL. *Ibid* 191, 328 MAKULIK *Ibid* 267, 404 ZERT. *Ibid* 378.—Polemie.

W. L. BADGER

Washing bone-black filters. FR. NOSEK. *Z. Zuckerind. cechoslov. Rep.* **51**, 399-400(1927).—The filters were washed with H₂O to 97 purity, then steamed for 1.5 hrs., and again washed. The results were a decrease of sweet water by 50-60%, the possibility of discarding the last impure wash, a saving in time of 4-5 hrs., and a sterilization of the filters.

W. L. BADGER

The influence of small additions of common salt and albumin on the taste of commercial sugars. HARALD LUNDÉN. *Centr. Zuckerind.* **35**, 419-20(1927).—Addns. of 0.002% NaCl to 3% sugar solns. had practically no effect. 0.01% NaCl increased the sweetness of refined beet sugars, and had little effect on cane sugars. There was little or no salty taste. 0.02% NaCl gave a salty taste to refined sugars, but not to an unrefined beet sugar of 99.90 purity. The lower the purity, the larger the amt. of NaCl that could be added without a salty taste. Egg albumin, added in amts. of 0.005% to 3% sugar solns., decreased the sweetness, more strongly in sugars of higher purity.

W. L. BADGER

The chemistry of starch. W. EKHARD. *Z. Spiritusind.* **50**, 172-3(1927).—A

discussion is given of diastatic and proteolytic enzymes and of the newer views on the structure, formation and chemistry of starch. C. N. FREY

Polarimetric determinations of starch. C. v. SCHEELE AND G. SVENSSON. *Svensk Kem. Tid.* 39, 233-44(1927).—Fryers and Lintner-Schwarz methods for barley starch agree very well with one another and starch-by-difference if correction is made for sol. rotating substances and if $(\alpha)_D$ is taken as 182.8° for the former and 203.2° for the latter method. The errors are 0.2 and 0.7° , resp. A. R. ROSE

The purification of corn starch sirup by means of Norit. W. BARTLING. *Z. Spiritusind.* 50, 122, 130, 137-8(1927).—Translation by Stirnus. A detailed description of the methods of mfg. corn starch sirup. The use of Norit during filtration is described. C. N. FREY

The treatment of beet flume and washer waters (HIRSCHFELDER) 14. Soil acidity and the growing of sugar beets (OGG) 15. Continuous centrifugals (PANKRATH) 1.

Extracting sugar from bagasse. HENRY ISTEILL. U. S. 1,645,242, Oct. 11. Bagasse is agitated and mixed with extracting fluid such as H_2O and simultaneously sprayed with the fluid, and the sugar soln. obtained is sepd. An app. is described.

The influence of sodium sulfide liquors in the manufacture of sole leather. VIRRO CASABURI. *Ledertech. Rundschau* 19, 105-11, 117-24, 129-35, 141-6(1927).—The soaking of dry hides can be eliminated if Na_2S is used instead of lime. The same quantity of OH^- is taken up by hide regardless of the concn. of Na_2S . The addn. of NH_4Cl to the Na_2S liquor is not needed for sole leather but is preferable for other leathers. $CaCl_2$ is a favorable action. The max. yield of leather is obtained after a $1.5^\circ B^e$. Na_2S or concn. $NaCl$. The high yield is obtained because there is no loss of hide surface in the soaks, the hide is completely hydrated and is only surface-neutralized. The swelling should be maintained up to the time of combination with tannin and a thin acid layer (pH 5) should precede the tannin soln. through the hide. Numerous photomicrographs are given. I. D. C.

Tanning and complete tanning. J. JOVANOVIĆ. *Collegium* 1927, 226-34.—

Collagen fibers show double refraction which is changed by heat, acids, alkalies or tannin (cf. Kuntzel, *C. A.* **20**, 1337). The isolated band-like fibers (probably elastin) are not changed. The polarization microscope can be used to follow the rate of tanning to test for green streaks in leather or burnt streaks in shoe soles. Very thin sections are not necessary.

The relation between tanning agents and vegetable dyes. KARL FREUDENBERG. *Festschrift 100-jähr. Besteh. Tech. Hochschule Karlsruhe* **1925**, 476-81; *Chem. Zentr.* **1926**, II, 2605.—Phloroglucinol tanning substances of high mol. wt. decomp. on energetic treatment into phloroglucinol, pyrocatechol and lower fatty acids. The same components should yield the hitherto unknown parent substances of phloroglucinol tanning substances. Moreover they should have the capacity for condensing irreversibly to tanning substances of high mol. wt. Since catechols, which occur in numerous plants, decomp. to the same products as do phloroglucinol tanning substances, and also readily condense, it is assumed that they are the parent substances of phloroglucinol tanning substances. The hypothesis of the correlation between the catechols and phloroglucinol tanning substances suggests in turn that there is a close relation between these assoc. groups and the vegetable dyes of the anthoxanthidin and anthocyanidin classes, since likewise in these substances phloroglucinol is combined with pyrocatechol. After recent researches, the relation between the catechols and the catechol tanning substances is regarded as established. A comparison of the formulas of the parent substances (hydrochalcone, catechol, catechol tanning substances, chalcone, anthocyanidin, flavone and flavonal) shows that the difference between these classes of substances rests on the stages of oxidation of the 3 C atoms lying among the C_6H_6 nuclei. If the occurrence in nature of the individual substances is investigated, it is found that members of the same classes often occur in the same plants. Where different stages of oxidation exist in a plant, these natural substances agree in the arrangement of their phenol hydroxyl groups. Thus from quercitol the series passes to cyanidin and thence to catechol. Quercitol and catechol are found together, as also are fisetin and the quebracho tanning substance, whose parent substance, quebrachocatechol, is still unknown. It is considered probable that an analogy exists between the still undiscovered fisetinidin and the likewise unknown catechol of the quebracho tanning substance. Since cyanidin can be hydrogenated to epicatechol, the hypothesis is considered of sufficient importance to justify expts. on the analogous conversion of fisetinidin to synthetically prep'd. quebrachocatechol and condensation to the corresponding amorphous tanning substance.

I. D. C.

A study by means of x-ray spectrographs of the tanning of skins and sinews. J. R. KATZ AND O. GERNGROSS. *Kolloid-Z.* **40**, 332-3(1926).—Examn. with monochromatic x-rays of a disk of leather cut parallel to the surface of the skin gives a diagram having a bright, "amorphous" inner ring and a very narrow outer ring comparable in sharpness with crystal interference patterns. Different leathers give the same diagram except for differences in the intensity of the 2 circles. Oak-bark-tanned leather has a weak outer circle and HCHO-tanned leather a very bright one. When sinews are exam'd., in which the collagen fibrils lie parallel to each other, the circles are resolved into more sharply defined segments. Tanning of such sinews for a long time in pine or quebracho ext. or in HCHO fails to change the x-ray diagram, but sinew tanned in oak ext. gives a diagram in which the outer crescents are less bright. The diagram for oak-tanned sinew resembles that for gelatin. The failure of HCHO tanning to alter the diagram is surprising since the HCHO presumably reacts with the basic groups of the protein. Perhaps the chem. reaction is limited to the surface of the micelles and the major part of the structure of the micelles remains unaltered. It is known that x-ray patterns are not altered by adsorption of other materials.

A titration method for the evaluation of enzymic bates. JOSEF SCHNEIDER AND ANTONIN VLCEK. *Collegium* **1927**, 342-9; cf. *C. A.* **21**, 2396.—Heat 30 cc. of casein soln. (90 g. per l., pH 8.4), 20 cc. of H_2O and 50 cc. of enzyme ext. in a thermostat at 40° for one hr. Then add 100 cc. Na_2SO_4 (100 g. salt and 50 cc. $NHCl$ per l.) to ppt. unchanged casein, filter, add 45 cc. of neutral 36% $HCHO$ and titrate with 0.1 N

NaOH and cresolphthalein. Oropion-Standard is used as the standard reference enzyme. Blanks without casein are run at the same time and corrections are made. The bate ext. is prepd. by leaching 2.5 g. of bate for 30 min. at 18° with 500 cc. of water contg. sufficient NH_4 salts to give 2.5 g. $(\text{NH}_4)_2\text{SO}_4$ and 1.0 g. NH_4Cl in the final ext. The NH_4 , SO_4 and Cl in the bate must be detd. in another ext. I. D. C.

The definition of the casein test as a method for evaluation of enzymic bates. J. SCHNEIDER AND A. VLCEK. *Gerber* 53, 134-5(1927); cf. *C. A.* 21, 1895.—Polematical.

H. B. MERRILL
The tannin of the native oak and the chestnut. ADOLF KURMEIER. *Collegium* 1927, 273-88.—Freshly extd. tannin from oak leaves and shoots was pptd. as the Pb salt, freed from Pb with H_2SO_4 , treated in dil. soln. with pyridine to remove condensation products, pptd. from this soln. with $\text{Pb}(\text{AcO})_2$, freed with H_2SO_4 and pptd. with quinine. Yield 60% of the raw tannin. The pure tannin was optically active, $[\alpha]_D = -30^\circ$, and contained no sugar before or after H_2SO_4 hydrolysis. Me compds. were prepd. Chestnut tannin seemed identical with oak except that the mol. wt. of the Me deriv. (660) was 20 units lower. Ellagic acid was removed from the tannin with NaOH, yield 16 17%, dil. H_2SO_4 , 12% or tannase 8-10%. Ellagic acid was detd. as pentaacetate, m. 222°, or pentamethyl deriv., m. 164°, of hexahydroxydiphenylcarboxylic acid. The latter is formed on boiling ellagic acid for 20 min. with 5% NaOH in the absence of air; boiling 45 min. gives hexahydroxydiphenyl. I. D. C.

Russian tannin plants. CARL PETERS. *Ledertech. Rundschau* 19, 146-8(1927).—A brief description of common bark and badan, taran (*Polygonum alpinum*), kermek (*Statice Latifolia*) and sumac. I. D. C.

Direct measurement of plumping power of tan liquors. R. E. PORTER, et al. *J. Am. Leather Chem. Assoc.* 22, 521-5(1927); cf. *C. A.* 20, 3359.—The plumping power of a soln. of chestnut ext., to which were added varying amounts of lactic acid and NaCl, was detd. by 4 diff. analysts by the hide-powder method. Satisfactory agreement between individual analysts was obtained. H. B. MERRILL

The influence of the method of reduction on the precipitation number. I. G. GRASSER AND S. SAWAYAMA. *J. Coll. Agr. Hokkaido Imp. Univ.* 20, Pt 2, 73-8(1927).—Different chrome tanning solns. of the same basicity have different pptn. nos. and consequently different behaviors in tanning. The org. reduction medium employed has a powerful influence on these characteristics. The expts. were carried out as follows: 50 cc. of 0.2 M $\text{K}_2\text{Cr}_2\text{O}_7$ soln. and 41.5 cc. of 1 M H_2SO_4 soln. were mixed and reduced with the vol. of each reducing agent indicated by the first number following its name and dild. to 250 cc. Ten cc. of this 250 cc. required the number of cc. of 0.1 N NaOH represented by the second number following each named substance to cause a cloudiness. Introductory remarks to and discussion of chemistry, bacteriology and histology of tanning. G. D. McLAUGHLIN, et al. *J. Am. Leather Chem. Assoc.* 22, 536-40(1927).—Discussion of 3 papers by the author and co-workers (*C. A.* 21, 3139). H. B. M.

Leather cements. WILLY HACKER. *Kunststoffe* 17, 202-3(1927).—The prepn. of leather cement for shoes and cement for glueing of leather straps is described. A no. of recipes are given. D. THUESSEN

The thermodynamics of temperature changes in collagen (WÖHLISCH, DE ROCHE-MONT) 11A. Formulas for 1927 fall shades on chrome-tanned side leather (ANON.) 25. Examination of halophilic microorganisms (CLAYTON, GIBBS) 11C. Determining pH values (WOLF) 7. Analysis of Na_2S (ATKIN, HUGONIN) 7.

Hide-disinfecting process. G. WESENBERG. *Can.* 274,780, Oct. 18, 1927. A

process for disinfecting hides, skins, etc., consists in treating these products with a soln. of a Na salt of *N*-chloro-*p*-toluenesulfonamide.

Treating fur hides. N. E. ANDERSSON. *Swed.* 63,275, July 5, 1927. The fleshy side of the hides in dry state preferably after grinding and dyeing is coated with a body-color consisting in a mineral pigment mixed with a binding substance. After drying the surface is spread with fat for impregnating purposes and is finally coated with a varnish.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Rubber chemistry. W. C. GEER. *Ind. Eng. Chem.* 19, 1095-8(1927).—A survey of developments in the rubber industry for which chemistry and chem. engineering are responsible, and without which automotive transportation on its present scale would have been impossible. Special attention is given to the production and improvement of reclaimed rubber and the continual improvements in automobile tires.

C. C. DAVIS

Rubber and its future. J. DUGUÉ. *Rev. gén. caoutchouc* 1927, No. 33, 23-6; No. 34, 19-22; cf. *C. A.* 21, 2815.—Chem. and technological developments of great historical significance are described.

C. C. DAVIS

Studies of rubber and its industry. J. CH. BONGRAND. *Rev. gén. caoutchouc* 1927, No. 33, 15-6, No. 34, 17-8, cf. *C. A.* 20, 839.—Special attention is paid to the part played by chemistry in new development.

C. C. DAVIS

Rubber and rubber mixtures considered from the standpoint of energetics. LOTHAR HOCK. *Kautschuk* 1927, 207-14; *Gummi-Ztg.* 41, 2126-7(1927).—The investigation was begun by the detn. of the *Joule effect in raw rubber*. The measurement of the heat tone during stretching and recovery with thermoclements was impracticable and resort was had to indirect detns. Unstretched rubber and rubber stretched to a predetd. elongation were swelled in a solvent to the same ultimate condition, so that the difference between the observed *heats of swelling* corresponded to the difference in energy between the 2 conditions of the rubber. The results of the measurements showed that the *latent heat of extension* is a linear function of the elongation, which conforms to x-ray studies. Below an elongation of 80%, the heating effect disappears. A comparison of the *heat tones* with the work performed, shows that the latter represents only an insignificant fraction of the latent heat, *i. e.*, the *Joule heat* is by no means an equiv. of a friction process. In connection with the exptl. detn. of the heat of extension, the problem of active fillers was studied from a thermodynamic standpoint. The mutual action between rubber and fillers would suggest that the heat tone of the mixts. does not correspond to the sum of the heat tones shown by rubber and by filler when swollen in a solvent. The difference is a function of the difference in energy of the rubber-filler system before mixing and the same system after being mixed. The difference in heat production may, therefore, be defined as the heat of adhesion. The first investigation showed that 1 g. of "Micronex" C black evolved 3.4 cal. of heat of adhesion within the mixt. and 1 g. of "Thermatomix" black only 1.3 cal. It might reasonably be assumed that the activities of the blacks bear the same relation to one another. Ap. *Std.* calen. shows that the *heats of adhesion* are proportional to the work required to break the rubber mixts. The *reinforcing effect of a filler* can be derived from the nature and the magnitude of the boundary surface of the filler and rubber. There is no relation between the total surface-energy, as measured calorimetrically, and the mech. work expended in breaking the rubber mixts., but only between the free energy and the work. The systems rubber-Dixie clay gas black and rubber-ZnO were investigated in particular detail. From detns. of the heat tone of mixts. of various concns. it was shown that the heats of adhesion decrease with increase in the concn. of the filler. From the ratios of the heats of adhesion at various concns. the utilization of the available surface energy of the particular filler could be estd. and a *measure of the distribution of the filler obtained*. Values of the surface energy measured calorimetrically when compared with the same values detd. from the stress-strain curves showed that the work required to rupture the rubber increased more rapidly with growing concn. of filler than did the total surface energy, in every case because of increasing internal friction. A general discussion follows the paper.

C. C. DAVIS

The energetics of rubber. Thermodynamics applied to the filler problem. LOTHAR HOCK. *India Rubber J.* 74, 419-21, 453-6(1927).—See preceding abstr.

C. C. DAVIS

New derivatives of rubber. G. BRUNI AND E. GEIGER. *Atti accad. Lincei* [6], 5,

823-8(1927).—During the classic researches of Angeli on the action of PhNO on unsatd. compds., it was noticed that PhNO vapor reacts with rubber (cf. Angeli, Alessandri and Pegna, *C. A.* 4, 2457), and later Alessandri prepd. from the same reagents an unidentified deriv. of rubber (cf. *C. A.* 9, 2240). Because these researches were left uncompleted and because of the potential value of PhNO derivs. for prepg. other derivs. of rubber, a comprehensive study was begun by B. and G. When C_4H_6 solns. of PhNO and rubber (3 mols. PhNO per C_4H_6) are heated 15 min. on the water bath, the soln. becomes green, then yellowish and finally red-brown, and on cooling and pouring into petr. ether, there forms a flocculent ppt. of the compn. $C_{11}H_{17}ON$. It is yellow, decomp. at 135-40°, and x-ray examn. shows no evidence of a cryst. structure. By evapn. of the petr. ether, a large quantity of PhN N(O)Ph is recovered, showing that the reaction proceeds as found by Angeli with other compds.: $[-CH_2.CMe.CH.CH_2-] + 2PhNO \rightarrow [-CH.CMe.C(N(O)Ph).CH-] + PhNH_2$ and $PhNH_2 + PhNO \rightarrow PhN.N(O)Ph + H_2O$. The product is, therefore, a nitrone, *isorubber nitrosobenzene*, and may have the alternative formula $[-CH_2.C(CH_2).C(N(O)Ph).CH_2-]$. The yield is 94-98%, so that its formation constitutes a *method for the direct detn. of raw rubber* which is preferable to those so far proposed. It absorbs Br to form a *dibromide* $[-CHBr.CMe.Br.C(N(O)Ph).CH-]$. The nitrone is also obtained by mixing pyridine solns. of PhNO and latex, which is the first time that a deriv. of rubber has been obtained directly from latex. In a similar manner from *o*-, *m*- and *p*- MeC_6H_4NO and *o*- $MeOC_6H_4NO$ were prepd. the corresponding nitrones: *isorubber o-nitrosotoluene*, *isorubber m-nitrosotoluene*, *isorubber p-nitrosotoluene* and *isorubber o-nitrosocumale*. Unlike *o*- $MeOC_6H_4NO$, nitrosophenols do not react, since they behave as quinone oximes. Rubber and *o*- ONC_6H_4CO-Et (3 mols. per C_4H_6) form *isorubber allyl o-nitrosobenzoate*, which treated with $EtONa$ and acidified with HCl, ppts. the corresponding acid, *isorubber o-nitrosobenzoic acid*, decomp. about 100°, insol. in water but forms true solns. in aq. alkalis. Such nitroso bases as *p*- ONC_6H_4NMe , *p*- ONC_6H_4NMe and $HN(C_6H_4NO)_2$ also react readily with rubber, the products of which are to be described. There may be some relation between the ready formation of these nitroso derivs. and the *accelerating power of nitroso compds.* Gutta-percha behaves like rubber, and *isogutta-percha nitrosobenzene* and its *dibromide deriv.* were prepd. Isorubber nitrosobenzene and $PhHNH_2$ react thus: $[-CH.CMe.C(N(O)Ph).CH_2-] + PhHNH_2 \rightarrow [-CH.CMe.C(NHPh).CH_2-] + PhNH_2$, forming the *phenylhydrazone*, decomp. at 140°. It is the phenylhydrazone of a ketone contg. the carbonyl in the chain of the rubber mol and the name *caudichone* (*caucichone*) is proposed. This compd. opens the way for the prepn. of the corresponding free ketones and from the latter to other unknown derivs., such as ammorrubber. C. C. DAVIS

Rubber and gutta-percha. 1. The condensation of rubber dibromide and of gutta-percha dibromide with phenols and with phenolic ethers. ERNST GEIGER. *Helv. chim. acta* 10, 530-8(1927).—The object of the expts. was to prove whether the Fiedel-Crafts reaction is applicable in general to bromides of high-mol. substances (cf. *Ber.* 33, 791(1900); Fisher, Gray and McCollm, *C. A.* 20, 1987). Rubber dibromide (25 g.), $FeCl_3$ (5 g.) and $PhOH$ (40 g.) heated 2 hrs. at 90-120° until clear, dild. with $EtOH$, filtered, poured slowly into warm dil. HCl, the ppt. purified by soln. in 3% alkali, repptn. by dil. HCl, resoln. in Me_2CO and final pptn. by dil. HCl, yields about 22 g. of bis(*p*-hydroxyphenyl)hydrorubber (II), the method of prepn. being simpler than that of Weber and of Fisher, Gray and McCollm (*loc. cit.*). Röntgenographic examn. indicated that II is amorphous. II (1 g.) in 20% KOH (50 cc.) shaken at 50° with $BaCl_2$ (2 g.), filtered, the residue dissolved in Me_2CO , repptd. by pouring into dil. KOH, yields about 1.5 g. of the *dibenzoate deriv.* of II, brown, m. 195-200°. I (2 g.), $FeCl_3$ (2 g.) and *o*-cresol (10 g.) heated 2 hrs. at 110-20°, poured in 1% NaOH (400 cc.), filtered, the residue (product + Fe_2O_3) digested at 50° with dil. HCl, treated with Me_2CO , poured into dil. HCl, ppts. 2.3 g. of bis(hydroxymethylphenyl)hydrorubber (III), brown, m. 165-78°, sol. in alkalis. III (0.5 g.) heated in 20% KOH (15 cc.) at 50°, with $BaCl_2$ (1 g.), filtered, dissolved in Me_2CO and repptd. by pouring into dil. KOH yields 0.75 g. of the *dibenzoate deriv.* of III, yellow-brown, m. 190-5°. Similarly were prepd. from *m*- and from *p*-cresol the corresponding bis(hydroxymethylphenyl)hydrorubbers (IV), with properties similar to those of III. I (5 g.), $FeCl_3$ (2.5 g.) and resorcinol (15 g.) heated 2-3 hrs. at 120-30°, $EtOH$ added, poured into dil. HCl and purified several times by pptn. with dil. HCl from Me_2CO , yields bis(dihydroxyphenyl)hydrorubber (IV), brown, does not m. below 300°, sol. in alkalis. Tetrahenzoate deriv., yellow-brown, m. 210-50°, insol. in alkalis. I (5 g.), $FeCl_3$ (2.5 g.) and pyrogallol (15 g.) heated 4-5 hrs. above the m. p. of pyrogallol, dissolved in $EtOH$, poured into dil. HCl at 50° gives a product the yield of which is 1.5-2.0 times that corresponding to bis(trihydroxy-

phenyl)hydrorubber, indicating that it is a mixt. which was not sepd. but which probably contained a higher condensation product. The behavior of the mixt. indicated that it contained in part *bis(trihydroxydiphenyl)hydrorubber*, sol. in alkalis. I (5 g.), FeCl_3 (2.5 g.) and anisole (20 g.) heated 4-5 hrs. at $110-20^\circ$, dild. with C_6H_6 , filtered, poured into EtOH contg. HCl and the ppt. purified from C_6H_6 -EtOH, yields 3.75 g. of *bis(p-methoxyphenyl)hydrorubber*, brown, m. $150-60^\circ$ (cf. Fisher, Gray and McCollm, *loc. cit.*), does not lower the f. p. of C_6H_6 , insol. in alkalis. I (5 g.), FeCl_3 (2.5 g.) and phenetole (20 g.) heated at $110-20^\circ$, dild. with C_6H_6 , filtered, poured into EtOH contg. HCl and the ppt. purified from C_6H_6 -EtOH, gives 3.5 g. of *bis(ethoxyphenyl)hydrorubber*, gray-brown, m. $210-5^\circ$, does not lower the f. p. of C_6H_6 . I (5 g.), FeCl_3 (2.5 g.) and $\alpha\text{-C}_{10}\text{H}_7\text{OMe}$ (20 g.) heated at $110-20^\circ$, extd. with C_6H_6 , evapd. *in vacuo*, the residue dissolved in Me_2CO and pptd. with EtOH or petr. ether, yields 5 g. of *bis(methoxynaphthyl)hydrorubber*, yellow-brown, m. $215-25^\circ$. Guttapercha dibromide (V) (2.5 g.), FeCl_3 (0.5 g.) and PhOH (10 g.) heated 4 hrs. at $110-20^\circ$, dild. with EtOH, filtered, poured into dil. HCl, the ppt. dissolved in Me_2CO and repptd. by petr. ether, yields 2.4 g. of *bis(p-hydroxyphenyl)hydroguttapercha*, brown, m. $170-5^\circ$ (decompn.), amorphous (judged by röntgenographic examn.), sol. in alkalis. *Dibenzoate deriv.*, prepd. by the Schotten-Baumann reaction, yellow-brown, m. $190-5^\circ$, does not lower the f. p. of C_6H_6 , insol. in alkalis. V (2.5 g.), FeCl_3 (0.5 g.) and *m*-cresol (10 g.) heated 4 hrs. at $110-20^\circ$, dild. with EtOH, poured in dil. HCl at 50° and the ppt. twice purified by pptn. by dil. HCl from soln. in Me_2CO , yields 2.4 g. of *bis(hydroxymethylphenyl)hydroguttapercha*, black-gray, m. $150-60^\circ$, sol. in alkalis. *Dibenzoate deriv.*, yellow-brown, m. $175-85^\circ$, insol. in alkalis. Similarly were prepd. from *o*- and *p*-cresol the corresponding *bis(hydroxymethylphenyl)hydroguttapercha* S, with similar properties. V (2.5 g.), FeCl_3 (0.5 g.) and resorcinol (11 g.) heated 4 hrs. at $120-30^\circ$, EtOH added, filtered, poured in aq. NaOH (5 g.), the ppt. redissolved and repptd. several times in the same way, yields *bis(dihydroxyphenyl)hydroguttapercha*, brown-black, does not m. up to 300° , sol. in alkalis. *Dibenzoate deriv.*, yellow, m. $195-200^\circ$, insol. in alkalis. Since the reaction products contained free OH groups, condensation took place on CH groups, and since with simple compds. of low mol. wt. condensation always takes place preferably in *p*-position to an OH group (cf. Staudinger and Widmer, *C. A.* 19, 908), it may be assumed by analogy that the same type of condensation is involved in the rubber derivs., thus:

II. Disazo derivatives of dihydroxy- and of tetrahydroxyphenylhydrorubber. *Ibid* 539-43.—The object was to det. whether hydroxyphenyl residues bound to paraffin chains in colloidal mols. react with diazonium salts. *p*-Dihydroxyphenylhydrorubber (I), (2.54 g.), 2% NaOH (50 cc.) and Na_2CO_3 (5 g.) treated at 0° with PhN:NCl soln. (corresponding to 1.86 g. PhNH_2), let stand 24 hrs. at 0° , warmed to 50° , acidified with HCl, filtered, the residue washed with hot water dissolved in PhMe and repptd. with petr. ether, yields 4.2 g. of *disazo deriv.* $\text{C}_{29}\text{H}_{26}\text{N}_4\text{O}_2$, brown, m. $205-10^\circ$ (decompn.), amorphous (judged by x-ray examn.), difficultly sol. in alkalis.

From the same quantity of I and the corresponding quantity of $p\text{-O}_2\text{NC}_6\text{H}_4\text{N:NCl}$ was prepd. 4.5 g. of *disazo deriv.* $\text{C}_{29}\text{H}_{24}\text{N}_6\text{O}_6$, brown-red, amorphous, m. $260-70^\circ$, also

formed when twice the proportion of $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}:\text{NCl}$ is used, difficultly sol. in alkalis. I diazotized in a similar way with diazonaphthionic acid, warmed to 40° , the free acid pptd. with concd. HCl, dissolved in alkali and repptd. by HCl, gives the corresponding *disazo deriv.*, black-gray, sol. in alkalis. A similar reaction is obtained with I and diazotized sulfanilic acid, though the free acid is pptd. only by very concd. HCl and NaCl. Diazotized benzidine and I form their corresponding *disazo deriv.*, brown. Bis(dihydroxyphenyl)hydrorubber (2.88 g.), 4% NaOH (50 cc.), Na_2CO_3 (5 g.) treated at 0° with $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}:\text{NCl}$ (corresponding to 2.76 g. $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$), let stand 1 hr., warmed to 50° , acidified, the ppt. washed and purified by pptn. in PhMe by petr. ether, gives 4.9 g. of the *disazo deriv.*, $\text{C}_{28}\text{H}_{24}\text{O}_8\text{N}_6$, brown, m. $210\text{--}5^\circ$ (decompn.), difficultly sol. in alkalis. C. C. DAVIS

Aging of soft rubber goods. R. F. TENER, W. H. SMITH AND W. L. HOLT. Bur. of Standards, *Tech. Paper No. 342*, 353–84 (1927).—To study the influence of light, heat, O, moisture, compn. and degree of vulcanization on the rate of deterioration of rubber goods, 4 representative and widely different rubber mixts. were aged under controlled conditions and the rate of deterioration was detd. Changes in tensile strength and in some cases changes in the Me_2CO ext. and combined S served as a measure of the deterioration. The method and technic, which are described in detail and illustrated, included exposure to (1) outdoors with no protection; (2) outdoors but in darkness; (3) outdoors under glass; (4) outdoors under glass and *in vacuo*; (5) outdoors under slightly colored glass *in vacuo*; (6) indoors to ordinary storage conditions; (7) dry air at 70° ; (8) moist air at 70° ; (9) normal air at 70° ; (10) O at 70° , 80° and 90° and (11) N at 70° , 80° and 90° . The influence of cure was in turn detd. by testing the 4 mixts. when uncured, when cured to the max. tensile strength and when overcured. Several general conclusions are derived from the exptl. work. All of the conditions are conducive to deterioration, but different rubber mixts. do not have the same relative resistance to the various influences, one mixt. being for instance relatively resistant to heating but sensitive to light, while another is relatively sensitive to heating but insensitive to light. As was to be expected, mixts. deteriorated as a result of oxidation faster in O than in air and faster in air than in N. Likewise they deteriorated faster in light than in darkness, and the higher the temp. the faster they deteriorated. *In vacuo*, sunlight formed a hard brittle coating which was insol. in common org. solvents and which contained more combined S than the unexposed and still elastic interior (cf. Williams, *C. A.* 20, 2093). For a given type of mixt., the darker the color the greater was its resistance to light, e. g., an uncolored mixt. showed a 5-fold increase in life in sunlight when it was blackened by incorporating 2% C black. In general the effect of light was more localized than that of O or of heat, and in most cases, but not in all, deterioration by light was manifest as a surface cracking. The presence of moisture did not materially alter the rate of deterioration in air at 70° . The changes in Me_2CO ext. and in combined S depended upon the conditions, the Me_2CO ext. increasing from oxidation and the combined S increasing through after-vulcanization, the first change being induced by O, and the second by heating. The state of cure had a marked effect on the aging, and for each mixt. there was a cure at which the resistance to the various influences was greatest. The effect of the state of cure was most marked in rubber-S mixts., for in this case overcured samples deteriorated rapidly regardless of the conditions. In mixts. contg. accelerators the rate of deterioration did not depend so much upon the state of cure. The results obtained with the *accelerated aging tests* did not in all cases agree with those obtained by natural aging, but such tests are of definite use in forecasting the behavior of rubber mixts. when stored in the usual way. Any quant. comparison, however, between natural and artificial aging is necessarily based on an indefinite standard, since natural aging has not been, as it should be, standardized. C. C. DAVIS

Aging properties of rubber coagulated with formic acid. R. RIEBL. *Arch. Rubber-cultur* 11, 354–66 (1927). (In abridged form in English 367–9.)—The expts. complete those already described (cf. *C. A.* 20, 312). After 2–3 yrs. raw rubber coagulated with HCO_2H was in the same condition as similar rubber coagulated with AcOH. The use of an excess of HCO_2H did not impair the good aging properties. Likewise there was no material difference after aging between the vulcanized samples prepd. from rubber coagulated with HCO_2H and those from rubber coagulated with AcOH. The use of HCO_2H in place of AcOH has, therefore, no disadvantage from an aging standpoint. C. C. DAVIS

The production of raw rubber. W. C. G. MEWES. *Z. Ver. deut. Ing.* 71, 1254–6 (1927).—An illustrated description of modern methods. C. C. DAVIS

Isolation of the natural oxidation inhibitors of crude Hevea rubber. H. A. BRUSON,

L. B. SEBRELL AND W. W. VOGT. *Ind. Eng. Chem.* **19**, 1187 91(1927); cf. Dinsmore, *C. A.* **21**, 194.—By means of a systematic scheme of sepi. and analysis, several hitherto unknown components were isolated from the Me₂CO ext. of raw rubber and 3 of them proved to be antioxidants. The ability of the substances to protect against oxidation was detd. by adding them to a rubber latex contg. Me₂CO-extd. rubber and no other ingredients with any protective action: Quebrachitol, *D*-valine, phytosterol, and other substances isolated by Whitby, Dohd and Yorton (cf. *C. A.* **20**, 3099) were first sepd., but none of these exhibited any protective action and the investigation was continued, the Me₂CO ext. being extd. with water, the aq. ext. neutralized and extd. with Et₂O, the water-insol. portion saponif., the unsaponifiable portion extd. with Et₂O and the new substances isolated from it. From the Et₂O ext. of the neutralized water ext. was obtained a substance with a strong reducing action and apparently a mixt. of phenols and ketones. It had some protective action against oxidation. From the unsaponifiable portion of the water-insol. residue of the Me₂CO ext. were isolated 5 substances: (1) *n*-octadecyl alc.; (2) the compd. C₂₇H₅₂O₂, probably a deriv. of phyto-sterol, reddish, viscous, odorless oil, b_p 258-60°, *n*_D²⁰ 1.5395, optically inactive, insol. in water and aq. alkalis, turned dark in air, gave the Salkowski and Tshugajeff reactions for sterols, gave a red to red-brown instead of a blue with the Whitby and Liebermann-Burchard reactions for sterols, was a very powerful antioxidant, reacted with Ac₂O and lost its antioxidant power, could be hydrogenated in EtOH with Pt to a hydrogenation compd. having no antioxidant properties, *α*-date, light red oil, *n*_D²⁰ 0.9°, (3) the compd. C₁₅H₂₄O, light yellow oil with intense cedar odor, b_p 105.7°, gave reactions of ketones and had no antioxidant power, (4) the compd. C₁₀H₁₆, light yellow oil with orange odor, b_p 210.5°, d₄²⁰ 0.8924, had no antioxidant power, and (5) the compd. C₂₀H₃₆O, reddish oil too impure to obtain a sharp b. p., gave reactions of sterols, had some antioxidant power, which disappeared on acetylation. Attempts to identify this substance led to the prepn. of the hitherto unknown *lanoleic alc.* in 40% yield by applying the method of Bouveault and Blanc (*Compt. rend.* **136**, 1676; **137**, 60(1903)), freezing below 0°, b_p 203°, *n*_D²⁰ 1.4615, d₄²⁰ 0.8586, oxidized in air, accelerated the oxidation of rubber and gave with Br liquid and solid bromides. Tests of the antioxidant power of oleic alc., chlorophyll, catosene, the crude distn. products of rubber, the unsaponifiable portion of cottonseed oil, stearic oil and balata resin, the ultra-violet radiation products of cholesterol and phytosterol, the C₂₇H₅₂O₂ deriv. of diacetylpentane, and chole-sterol and phyto-sterol ozonides, showed them all to be lacking in antioxidant power. Raw rubber is immune to oxidation only when the natural antioxidants are present, and in importance they are comparable to chlorophyll, vitamins, and other biol. active substances. C. C. DAVIS

Some remarks on antioxidants and rubber. GUSTAVE BERNSTEIN. *Rev. gén. caoutchouc* **1927**, No. 34, 3.—In the reference to prevent discussions of the priority of discovery and application of antioxidant, (cf. Mooren, *C. A.* **21**, 2816), attention is called to the rubberized cloth protected by the action of tannin and hydroquinol which was exhibited in London in 1911, to the patent of Helbronner (*French patent* 509,667 (1919)) and to papers by Fickensley. C. C. DAVIS

Some remarks on antioxidants and rubber. (Reply to Gustave Bernstein.) CHARLES MOUREU AND CHARLES DETRAISE. *Rev. gén. caoutchouc* **1927**, No. 34, 3-4, cf. preceding abstr.—Polémicd. Priority is claimed for the use of antioxidants to improve the aging of rubber, and the paper of Helbronner and Bernstein (*C. A.* **17**, 3625) is quoted to prove that the latter had formerly held the same view. The Helbronner patent does not consider the continuous and virtually catalytic action of disproportionately small quantities of antioxidants. C. C. DAVIS

Stearic acid as a rubber-compounding ingredient. W. B. WIEGAND. *Can. Chem. Met. J.* **21**, 211-12; *India Rubber J.* **74**, 488 9(1927).—A review and description of the source, method of production and physical properties of stearic acid, and the results obtained with it in rubber compounding. The proportion of stearic acid to be used depends upon various factors, such as the softening desired, the pigment to be dispersed, the particular accelerator, the proportion of ZnO present and the type of rubber used. Despite its general adaptability, it must be used with caution in some work where mixts. contg. it are allowed to stand, for the oleic acid present in the usual com. grades tends to "bloom" and render the surfaces non-adhesive. C. C. DAVIS

Rubber tests for non-experts. T. E. H. O'BRIEN. *India Rubber J.* **74**, 421-4 (1927).—A description, for those not versed in the technology of rubber, of the properties of rubber and standard methods of testing. C. C. DAVIS

The characterization and testing of reclaimed rubbers. PAUL ALEXANDER.

India Rubber J. **74**, 413-5(1927).—An English version of a previous article (*C. A.* **21**, 1374). C. C. DAVIS

Soft rubber filter-press plates and frames. H. E. FRITZ AND J. H. CLARK, JR. *Ind. Eng. Chem.* **19**, 1151(1927).—Expts. show that semi-hard rubber of suitable compn. is superior in several respects to other materials for the parts of a filter-press which are in contact with the corrosive liquid. This use extends to a wide variety of corrosive liquids, a list of which is included, with the max. temp. and concn. where the use of rubber was found practicable. C. C. DAVIS

Use of perchloric acid as oxidant for the determination of sulfur in rubber. ERNEST KAHANE. *Ann. chim. anal. chim. appl.* **9**, 261-4(1927).—See *C. A.* **21**, 2817. W. T. H.

Balata. M. TILLINAC. *Rev. gén. caoutchouc* **1927**, No. 34, 37-40.—The properties of balata latex and of the gum and the uses of the latter are described. C. C. D.

Explanatory notes on vulcanization testing of rubber. T. E. H. O'BRIEN. *Trop. Agr. (Ceylon)* **69**, 13-9(1927).—Four tables give data obtained by the Ceylon Rubber Research Scheme on the effect of Na_2SiF_6 and of *p*-nitrophenol upon rubber. A. L. MEHRING

Vulcanization and devulcanization of rubber. PAUL BARY. *Rev. gén. caoutchouc* **1927**, No. 34, 10-12.—Present knowledge regarding the chem. combination of S and rubber, the structure of the rubber mol. and the hydrogenation of rubber are discussed. C. C. DAVIS

The vulcanization of rubber by sulfur. F. BOIRY. *Caoutchouc & gutta-percha* **24**, 13,476-7, 13,510-11, 13,546-8, 13,618(1927); cf. *C. A.* **19**, 1964; **21**, 1375.—An extended discussion of past research, in conjunction with new expts., leads to certain general conclusions. Vulcanization is the result of 3 phenomena: (1) chem. combination of S and rubber with formation of addn. compds.; (2) polymerization or aggregation of these addn. compds., and (3) depolymerization of the rubber through external influences. Vulcanization is essentially a result of (1) and (2). Depolymerization, which always takes place during vulcanization by S, is only a "parasitic" phenomenon, and is in no way indispensable to the processes designated (1) and (2). It is manifest in hot and in cold vulcanization in the presence of an ultra-accelerator. In the latter case, however, it is less pronounced and its partial absence under these conditions accounts for the superior phys. properties of rubber vulcanized with an ultra-accelerator. It is the phenomenon of aggregation or polymerization which accounts for the characteristic phys. properties of vulcanized rubber, such as its insol., elasticity and rigidity. This aggregation can, however, progress only when chem. combination of S and rubber has already taken place. In vulcanization of rubber in the solid state, all 3 phenomena occur less simultaneously, whereas in vulcanization in soln., polymerization does not occur and occurs only to a limited extent at the most, and becomes complete only after removal of the solvent. Even in dry vulcanized rubber, polymerization is incomplete, and it continues after vulcanization, the phenomena of aging being at least in part a result of this continued aggregation. The latter does not take place among components of the same chem. compn., e. g., between mols. of rubber more or less sulfurated and those of unsulfurated vulcanized rubber, but only among products having the same or very nearly the same chem. compn. Aggregation probably begins as soon as 1 atom of S has combined with a mol. of rubber to form the compd. $(\text{C}_6\text{H}_8)_n\text{S}$. Vulcanization as represented by the compd., and in general by rubber with a low S content, is clearly evident only when the rubber has not been depolymerized by mech. treatment or by heat. Though the combination of S into the rubber mol. is indispensable for the process of aggregation, it is not a condensing agent which unites through its primary valences the mols. of rubber. Aggregation is rather a result either of adsorption or of an exchange of secondary valences between the S and the rubber mols. All that can be said is that sulfurated rubber has a greater tendency to aggregate than has unvulcanized rubber, and the higher the combined S the greater this tendency. Vulcanized rubber is then formed of components, the chem. compus. of which are nearly the same. Because of its high mol. wt. and the great no. of ethylene bonds which it contains, the rubber mol. can give numerous sulfurated derivs. Though all the rubber reacts with S during vulcanization, it is improbable that all the mols. react in the same way, and if in some mols. the n double bonds satd. by S, in others there may be $n-1$ or $n+1$. These components are grouped in complexes of more or less high order. Those of the highest order in which the components richest in S predominate, have a weak affinity for solvents. Those of not so high an order and richer in less sulfurated components are soluble and are responsible for the swelling of vulcanized rubber. In this connection the fraction which is extractable with solvents usually has a lower S content than rubber

which is insol. The forces which keep the mols. of vulcanized rubber firmly united are on the one hand the forces which are active in the unvulcanized rubber, and on the other hand are the forces which are active in the combination of S and rubber. Rubber is probably a 2-phase system in which under certain conditions it is possible to sep. a liquid phase and an elastic solid phase. The latter is formed of complexes of a higher order, and the liquid phase of complexes of a lower order. C. C. DAVIS²⁶

The molding and vulcanization of rubber articles. H. WILLSHAW. *Chemistry & Industry* 46, 760-4, 783-5 (1927); cf. C. A. 21, 671. —A general description, with illustrations and diagrams, of modern equipment with the principles and technic involved. C. C. DAVIS

Some accelerator characteristics as revealed by coefficients of vulcanization. A. F. HARDMAN AND F. L. WHITE. *Ind. Eng. Chem.* 19, 1037-40 (1927). —Whereas in a rubber-S mixt., combination of S proceeds at a uniform rate nearly to exhaustion, this is not true when org. accelerators and ZnO are also present. Tests show that the effect depends upon the particular accelerator, for in cases where the latter is decompd. during vulcanization, the rate of combination of S decreases with time, and with accelerators which are stable during vulcanization the rate of combination is similar to that in a rubber-S mixt. Between these extreme cases are found the majority of important accelerators, the combined S curves indicating progressive changes in the accelerating power as the time of vulcanization increases. The *stable group* is exemplified by hexamethylenetetramine and triphenylguanidine, the *transient group* by Zn ethylxanthate and Pb dithiofuroate, and the *intermediate group* by diphenylguanidine, tetramethylthiuram monosulfide and Zn dithiocarbamate. C. C. DAVIS

A new light factice for hot and cold cures which does not react with accelerators. RUDOLF DITMAR. *Chem. Ztg.* 51, 599 (1927). —A new white factice ("Gloria" made by Georg Grandel, Augsburg) made with S_2Cl_2 is described. It contains no active Cl, is acid-free and is completely saponifiable. It combines the stability of brown factices with a bright yellow color. It may be used in large proportions, e. g., 30%, in rubber mixts. without impairing the quality, and around 20-25% it has a reinforcing action. Because it contains no active Cl, it does not inhibit the full activity of org. accelerators and does not influence the aging adversely. C. C. DAVIS

C black (U. S. pat. 1,643,736) 18.

Rubber compound. C. ELLIS and N. BOEHMER. Can. 273,676, Sept. 6, 1927. A chlorine-fluxed chlorinated rubber contains in excess of $\frac{2}{3}$ of its wt. of combined Cl_2 .

Bituminous composition containing rubber. J. CAMPBELL. Brit. 263,028, May 29, 1926. A mixt. for spraying roads, coating Fe or wood, use in roofing, etc. is made by boiling together rubber 70 and bitumen 30 parts, with or without small proportions of pitch, resin, S, rubber solvent or soln., plaster of Paris or fibrous material.

Treating rubber latex. H. W. KELLEY and WM. D. WOLFE. U. S. 1,644,730, Oct. 11. Rubber latex contg. NH_3 is treated with H_3BO_3 , borax or other compd. of B_2O_3 of suitable character and with a polyhydroxy compd. such as dextrose or glycerol in which the OH groups are attached to adjacent C atoms. This treatment serves to remove ammoniacal odor.

Forming-seamed hollow rubber articles. R. T. GRIFFITHS. U. S. 1,644,122, Oct. 4. Mech. features.

Vulcanizing rubber. C. W. BEDFORD. U. S. 1,645,084, Oct. 11. Reaction is effected between S 32 and *p*-phenylenediamine 108 parts, suitably at a temp. of about 180-200° in order to form an accelerator. Other N-contg. accelerators also may be heated with S.

Vulcanization. J. TEPPEMA. Can. 274,450, Oct. 4, 1927. The vulcanization of rubber is accelerated by a halogen deriv. of a mercaptoarylthiazole.

Vulcanization. L. B. SEBRELL. Can. 274,446, Oct. 4, 1927. An aldehyde aromatic amine reaction product, part or all of the aldehyde reagent being of an unsatd. aliphatic character, is used as an accelerator of vulcanization. Cf. C. A. 21, 3768.

Vulcanization. L. B. SEBRELL. Can. 274,445, Oct. 4, 1927. A vulcanizing agent is mixed with rubber and there is incorporated in the mixt. a product formed by the condensation of an aldol with an amine, together with an activator, and heat is applied. Cf. C. A. 21, 3768.

Apparatus for vulcanizing inner tire tubes. O. J. KUHLE. U. S. 1,644,678, Oct. 11.

Apparatus for making continuous sheets of rubberized felted material. WM. G. O'BRIEN. U. S. 1,645,068, Oct. 11.

I. AUTHOR INDEX

("P" before a page number indicates "Patent")

NOTE.—In the transliteration of names originally written in Russian, the system followed so far is possible is that of *Nature* (Feb. 27, 1890), in which *v* is used instead of the *w* or *f* of other spellings; *sch* instead of *sch*, *ch* instead of *tch*, *i* instead of *j* or *y*, etc. Thus Pavlov, not Pawlow, Chugaev, not Tschugaeff. To make quite sure, users of the index should in such a case look under both spellings.
